| 2.1      | Key project details                                              | 2-1        |
| 2.1.1    | Background                                                       | 2-1        |
| 2.1.2    | Summary description                                              | 2-1        |
| 2.1.3    | Environmental classification                                     | 2-2        |
| 2.1.4    | Geographical location and administrative affiliation             | 2-3        |
| 2.2      | Project objective and rationale                                  | 2-4        |
| 2.3      | Compatibility of the project                                     | 2-5        |
| 2.3.1    | Legislative framework                                            | 2-5        |
| 2.3.2    | Spatial planning & land use                                      | 2-6        |

|          |                                                                                                   |      |
|----------|---------------------------------------------------------------------------------------------------|------|
| 2.3.2.1  | Spatial planning                                                                                  | 2-6  |
| 2.3.2.2  | Land use                                                                                          | 2-7  |
| 2.3.3    | Environmental sensitivity aspects of the project                                                  | 2-7  |
| 2.4      | Technical description of the project                                                              | 2-8  |
| 2.5      | Alternatives                                                                                      | 2-11 |
| 2.5.1    | Assessment of alternatives                                                                        | 2-11 |
| 2.6      | Current environmental conditions                                                                  | 2-15 |
| 2.6.1    | Natural environment                                                                               | 2-16 |
| 2.6.2    | Biotic environment                                                                                | 2-17 |
| 2.7      | Quantitative Risk Assessment (QRA)                                                                | 2-20 |
| 2.8      | Assessment and evaluation of environmental and social impacts                                     | 2-23 |
| 2.8.1    | Identification and assessment of significant environmental parameters                             | 2-23 |
| 2.8.2    | Assessment of potentially significant impacts from the normal / routine activities of the project | 2-27 |
| 2.9      | Assessment of cumulative/synergistic effects                                                      | 2-66 |
| 2.9.1    | Commercial shipping, ferry services and international shipping                                    | 2-66 |
| 2.9.2    | Commercial fishing and fishing grounds                                                            | 2-67 |
| 2.9.3    | Maritime tourism, recreational boating and cruises                                                | 2-69 |
| 2.9.4    | Aquaculture activities                                                                            | 2-69 |
| 2.9.5    | Submarine telecommunications and power cables                                                     | 2-71 |
| 2.9.6    | Offshore oil and gas installations                                                                | 2-73 |
| 2.9.7    | Offshore wind energy, ocean energy and other offshore renewable energy sources                    | 2-74 |
| 2.9.8    | Port activities in Igoumenitsa and land-based support base                                        | 2-76 |
| 2.9.9    | Military exercise areas and restricted-access maritime zones                                      | 2-76 |
| 2.9.10   | Combined synergistic effects on shared receptors                                                  | 2-76 |
| 2.10     | Assessment of transboundary environmental impacts                                                 | 2-77 |
| 2.10.1   | Geographical boundaries of the area of operation                                                  | 2-77 |
| 2.10.2   | Expected transboundary environmental impacts                                                      | 2-78 |
| 2.10.2.1 | Seawater quality                                                                                  | 2-79 |
| 2.10.2.2 | Seabed                                                                                            | 2-79 |
| 2.10.2.3 | Underwater noise                                                                                  | 2-80 |
| 2.10.2.4 | Air quality                                                                                       | 2-81 |
| 2.10.2.5 | Maritime and air traffic                                                                          | 2-81 |
| 2.10.2.6 | Waste generation and management                                                                   | 2-82 |
| 2.10.2.7 | Accidental hydrocarbon spill                                                                      | 2-82 |
| 2.11     | Addressing environmental and social impacts                                                       | 2-83 |

|      |                                     |       |
|------|-------------------------------------|-------|
| 2.12 | Environmental and social monitoring | 2-109 |
|------|-------------------------------------|-------|

### **3 Brief project description 3-1**

|         |                                              |      |
|---------|----------------------------------------------|------|
| 3.1     | Project elements                             | 3-1  |
| 3.1.1   | Main infrastructure and activities           | 3-1  |
| 3.1.2   | Support infrastructure                       | 3-3  |
| 3.2     | Development phases                           | 3-4  |
| 3.2.1   | Mobilisation phase                           | 3-4  |
| 3.2.1.1 | Offshore activities                          | 3-4  |
| 3.2.1.2 | Onshore logistics support and transport base | 3-5  |
| 3.2.2   | Drilling phase                               | 3-5  |
| 3.2.2.1 | Offshore activities                          | 3-5  |
| 3.2.2.2 | Onshore logistics support and transport base | 3-6  |
| 3.2.3   | Decommissioning phase                        | 3-6  |
| 3.2.3.1 | Offshore decommissioning and restoration     | 3-6  |
| 3.2.3.2 | Onshore decommissioning and restoration      | 3-7  |
| 3.3     | Raw materials, energy and water resources    | 3-7  |
| 3.3.1   | Requirements of raw materials                | 3-7  |
| 3.3.1.1 | Offshore activities                          | 3-7  |
| 3.3.1.2 | Onshore logistics support and transport base | 3-8  |
| 3.3.2   | Water requirements                           | 3-8  |
| 3.3.2.1 | Offshore activities                          | 3-8  |
| 3.3.2.2 | Onshore logistics support and transport base | 3-8  |
| 3.3.3   | Energy requirements                          | 3-9  |
| 3.3.3.1 | Offshore Activities                          | 3-9  |
| 3.3.3.2 | Onshore logistics support and transport base | 3-9  |
| 3.4     | Discharges and waste                         | 3-10 |
| 3.4.1   | Wastewater                                   | 3-10 |
| 3.4.1.1 | Offshore activities                          | 3-10 |
| 3.4.1.2 | Onshore logistics support and transport base | 3-11 |
| 3.4.2   | Discharges and waste                         | 3-11 |
| 3.4.2.1 | Offshore activities                          | 3-11 |
| 3.4.2.2 | Onshore logistics support and transport base | 3-12 |
| 3.5     | Air emissions                                | 3-12 |
| 3.5.1   | Offshore activities                          | 3-12 |
| 3.5.2   | Onshore logistics support and transport base | 3-13 |
| 3.6     | Carbon footprint                             | 3-13 |

|       |                                                       |      |
|-------|-------------------------------------------------------|------|
| 3.6.1 | Offshore activities                                   | 3-13 |
| 3.6.2 | Onshore logistics support and transport base          | 3-13 |
| 3.7   | Noise and vibration emissions                         | 3-14 |
| 3.7.1 | Offshore activities                                   | 3-14 |
| 3.7.2 | Onshore logistics support and transport base          | 3-15 |
| 3.8   | Electromagnetic radiation and radioactivity emissions | 3-15 |

## **4 Project rationale and objectives 4-1**

|           |                                                                    |      |
|-----------|--------------------------------------------------------------------|------|
| 4.1       | Energy security                                                    | 4-1  |
| 4.1.1     | Rationale and objectives from project implementation               | 4-2  |
| 4.1.1.1   | Project rationale                                                  | 4-2  |
| 4.1.1.2   | Project objectives                                                 | 4-3  |
| 4.1.1.2.1 | Technical and operational objectives                               | 4-3  |
| 4.1.1.2.2 | Environmental and execution objectives                             | 4-4  |
| 4.1.1.2.3 | Long-term knowledge objectives                                     | 4-4  |
| 4.1.2     | Feasibility                                                        | 4-4  |
| 4.1.2.1   | Geological and subsurface                                          | 4-5  |
| 4.1.2.2   | Technical and operational                                          | 4-5  |
| 4.1.2.3   | Environmental and regulatory                                       | 4-6  |
| 4.1.2.4   | Economic and financial                                             | 4-6  |
| 4.1.2.5   | Conclusions                                                        | 4-6  |
| 4.1.3     | Expected benefits on local, regional and national levels           | 4-7  |
| 4.1.3.1   | Energy diversification and sustainable development                 | 4-7  |
| 4.1.3.2   | Economic and community benefits                                    | 4-7  |
| 4.1.3.3   | Employment benefits                                                | 4-8  |
| 4.1.3.4   | Knowledge and capacity building benefits                           | 4-9  |
| 4.2       | Hydrocarbon exploration well projects - brief overview             | 4-10 |
| 4.2.1     | Background - international experience in exploration well projects | 4-10 |
| 4.2.1.1   | Operated offshore drilling experience - Israel                     | 4-10 |
| 4.2.1.2   | Operated offshore drilling experience - Morocco                    | 4-11 |
| 4.2.1.3   | Operated offshore drilling experience - Greece                     | 4-11 |
| 4.2.1.4   | Non-operated offshore exploration experience                       | 4-11 |
| 4.2.2     | Progress of exploration well projects in Europe                    | 4-12 |
| 4.3       | Project historical development                                     | 4-16 |
| 4.4       | Economic valuation of GHG emissions                                | 4-17 |
| 4.5       | Financial elements                                                 | 4-18 |
| 4.6       | Relation with other projects/activities                            | 4-19 |

|       |                                                                                 |      |
|-------|---------------------------------------------------------------------------------|------|
| 4.6.1 | Operational, planned, and proposed projects within the Adriatic–Ionian corridor | 4-19 |
| 4.6.2 | Sectoral upstream activities – Ionian offshore exploration                      | 4-20 |

## 5 Project compatibility with the existing regulatory provisions 5-1

|           |                                                                                                                                                                                                                                                                   |      |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------|
| 5.1       | Environmental permitting framework                                                                                                                                                                                                                                | 5-1  |
| 5.1.1     | Concession (lease agreement)                                                                                                                                                                                                                                      | 5-1  |
| 5.1.2     | Strategic Environmental Impact Assessment (SEA) for the offshore hydrocarbon exploration & exploitation areas in the Ionian Sea                                                                                                                                   | 5-5  |
| 5.1.3     | Existing permitting status of Igoumenitsa Port and Corfu International Airport (CFU)                                                                                                                                                                              | 5-13 |
| 5.2       | Legislative framework                                                                                                                                                                                                                                             | 5-17 |
| 5.2.1     | Legislation related to hydrocarbon exploration and production                                                                                                                                                                                                     | 5-17 |
| 5.2.1.1   | National Law 2289/1995 for exploration, research and exploitation of hydrocarbons                                                                                                                                                                                 | 5-17 |
| 5.2.1.2   | National Law 4001/2011 on Electricity, Natural Gas and Hydrocarbons                                                                                                                                                                                               | 5-18 |
| 5.2.2     | Broader framework of environmental permitting                                                                                                                                                                                                                     | 5-19 |
| 5.2.2.1   | Directive 2011/92/EU on the assessment of the effects of certain public and private projects on the environment (EIA)                                                                                                                                             | 5-19 |
| 5.2.2.2   | Legislative Framework for Impact Assessment                                                                                                                                                                                                                       | 5-22 |
| 5.2.2.2.1 | Law 4014/2011 on the Environmental Permitting of Projects and Activities                                                                                                                                                                                          | 5-24 |
| 5.2.2.2.2 | Law 4685/2020 - Modernization of Environmental Legislation and Other Provisions                                                                                                                                                                                   | 5-26 |
| 5.2.2.2.3 | Integration of Climate Law into Impact Assessment                                                                                                                                                                                                                 | 5-29 |
| 5.2.2.3   | Directive 2001/42/EC on the assessment of the effects of certain plans and programmes on the environment (SEA Directive)                                                                                                                                          | 5-30 |
| 5.2.2.4   | National Legislation for Strategic Environmental Assessment (SEA)                                                                                                                                                                                                 | 5-30 |
| 5.2.2.5   | Directive 2008/98/EC on Waste and Repealing Certain Directives (Waste Framework Directive)                                                                                                                                                                        | 5-31 |
| 5.2.2.6   | Convention on Environmental Impact Assessment in a Transboundary Context (Espoo Convention)                                                                                                                                                                       | 5-32 |
| 5.2.3     | Legislative framework for the prevention of marine pollution                                                                                                                                                                                                      | 5-34 |
| 5.2.3.1   | Directive on the safety of offshore oil and gas operations (2013/30/EU)                                                                                                                                                                                           | 5-34 |
| 5.2.3.2   | National Law 4409/2016 for the framework for safety in offshore hydrocarbon exploration and exploitation operations, transposition of Directive 2013/30/EU, amendment of Presidential Decree 148/2009, and other provisions                                       | 5-35 |
| 5.2.3.3   | Water Framework Directive (WFD) 2000/60/EC                                                                                                                                                                                                                        | 5-36 |
| 5.2.3.4   | Marine Strategy Framework Directive (MSFD), 2008/56/EC                                                                                                                                                                                                            | 5-37 |
| 5.2.3.5   | Law 3983/2011 for the National Strategy for the Protection and Management of Marine Environment - Harmonization with Directive 2008/56/EC                                                                                                                         | 5-37 |
| 5.2.3.6   | Environmental Liability Directive (ELD) (2004/35/EC)                                                                                                                                                                                                              | 5-39 |
| 5.2.3.7   | Directive 2009/123/EC, which amends Directive 2005/35/EC on ship-source pollution and the introduction of penalties, including criminal penalties for infringements, aims to strengthen the legal framework addressing illegal discharges of polluting substances | 5-40 |
| 5.2.3.8   | The Bathing Water Directive (2006/7/EC)                                                                                                                                                                                                                           | 5-41 |
| 5.2.3.9   | Convention for the protection of the mediterranean sea against pollution (Barcelona Convention)                                                                                                                                                                   | 5-42 |

|           |                                                                                                                                                                                                    |      |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------|
| 5.2.3.9.1 | The Protocol for the protection of the mediterranean sea against pollution resulting from exploration and exploitation of the continental shelf and the seabed and its subsoil (Offshore Protocol) | 5-43 |
| 5.2.3.9.2 | Comparative analysis between the Offshore Protocol (Barcelona Convention) and EU Directive on safety of offshore oil and gas facilities (2013/30/EC)                                               | 5-48 |
| 5.2.3.10  | International Convention for the prevention of pollution from ships (MARPOL)                                                                                                                       | 5-49 |
| 5.2.3.11  | IMO Convention on Oil Pollution Preparedness, Response and Co-operation (OPRC)                                                                                                                     | 5-51 |
| 5.2.3.12  | United Nations Convention on the Law of the Sea (UNCLOS)                                                                                                                                           | 5-52 |
| 5.2.3.13  | Stockholm Convention on Persistent Organic Pollutants (POPs)                                                                                                                                       | 5-52 |
| 5.2.3.14  | International Convention for the Safety of Life at Sea (SOLAS) regarding Noise Emissions on Ships                                                                                                  | 5-52 |
| 5.2.3.15  | International convention on the establishment of an international Fund for Compensation for Oil Pollution Damage (FUND)                                                                            | 5-53 |
| 5.2.3.16  | Directive 2012/18/EU on the Control of Major-Accident Hazards Involving Dangerous Substances (Seveso III Directive)                                                                                | 5-54 |
| 5.2.3.17  | International convention for the control and management of ships ballast water and sediments (BWM)                                                                                                 | 5-55 |
| 5.2.3.18  | Industrial emissions directive (2010/75/EU)                                                                                                                                                        | 5-57 |
| 5.2.3.19  | Convention for the prevention of marine pollution by dumping of wastes and other matter (London Convention)                                                                                        | 5-57 |

|----------------------------------------------------------------------------------------------------------|------|
| 6.14.3 Onshore decommissioning                                                                           | 6-77 |
| 6.14.3.1 Demolition of permanent structures, removal of equipment and materials, and methods of disposal | 6-78 |
| 6.14.3.2 Restoration of the occupied site                                                                | 6-78 |
| 6.14.4 Carbon footprint after completion of project operation                                            | 6-78 |

## **7 Alternative Solutions** **7-1**

|                                                            |      |
|------------------------------------------------------------|------|
| 7.1 No-Action Alternative                                  | 7-1  |
| 7.1.1 Technical and Strategic Implications                 | 7-2  |
| 7.1.2 Environmental and Scientific Considerations          | 7-2  |
| 7.1.3 Socio-economic Considerations                        | 7-2  |
| 7.2 Description of Alternative Solutions                   | 7-3  |
| 7.2.1 Introduction                                         | 7-3  |
| 7.2.2 Exploration Well Location                            | 7-4  |
| 7.2.3 Well Trajectory                                      | 7-5  |
| 7.2.4 Drilling Unit Type                                   | 7-6  |
| 7.2.5 Drilling Strategy Sequence                           | 7-8  |
| 7.2.6 Drilling Fluids                                      | 7-9  |
| 7.2.7 Treatment/Disposal of Drilling Fluids and Cuttings   | 7-11 |
| 7.2.8 Cement Systems                                       | 7-12 |
| 7.2.9 Lighting                                             | 7-14 |
| 7.2.10 Well Decommissioning                                | 7-15 |
| 7.2.11 Management of Operations and Support Infrastructure | 7-16 |
| 7.2.11.1 Shore base                                        | 7-16 |
| 7.2.11.2 Heliport                                          | 7-18 |
| 7.2.11.3 Support Vessels                                   | 7-19 |
| 7.3 Evaluation of Alternatives                             | 7-19 |
| 7.4 Conclusion                                             | 7-24 |

## **8 Baseline environmental conditions** **8-1**

|                                                     |     |
|-----------------------------------------------------|-----|
| 8.1 Study area                                      | 8-2 |
| 8.2 Climate and bioclimatic characteristics         | 8-3 |
| 8.2.1 Climatic characteristics                      | 8-3 |
| 8.2.2 Oceanographic characteristics                 | 8-4 |
| 8.2.3 Bioclimatic Characteristics                   | 8-5 |

## **10 Assessment and Evaluation of environmental impacts 10-1**

|            |                                                                                        |       |
|------------|----------------------------------------------------------------------------------------|-------|
| 10.1       | Assessment of potentially significant impacts from normal / routine project activities | 10-1  |
| 10.1.1     | Impact assessment and evaluation methodology                                           | 10-1  |
| 10.1.1.1   | Recognition and evaluation of significant environmental aspects                        | 10-1  |
| 10.1.1.2   | Environmental and social scoping                                                       | 10-5  |
| 10.1.1.3   | Assessment of Environmental and Social Impacts                                         | 10-16 |
| 10.1.1.3.1 | Calculation of the significance of impacts                                             | 10-16 |
| 10.1.1.3.2 | Evaluation of Environmental and Social Impacts                                         | 10-22 |
| 10.1.2     | Impacts related to climate resilience                                                  | 10-23 |
| 10.1.2.1   | Impacts on climatic and bioclimatic characteristics                                    | 10-23 |
| 10.1.2.1.1 | Drilling preparation and mobilization phase                                            | 10-23 |
| 10.1.2.1.2 | Exploration drilling operations phase                                                  | 10-24 |
| 10.1.2.1.3 | Demobilisation and abandonment phase                                                   | 10-25 |
| 10.1.2.2   | Climate change mitigation                                                              | 10-25 |
| 10.1.2.3   | Climate change adaptation                                                              | 10-27 |
| 10.1.2.3.1 | Screening                                                                              | 10-28 |
| 10.1.2.3.2 | Risk assessment                                                                        | 10-36 |
| 10.1.2.3.3 | Measures to enhance climate change adaptation - residual risk                          | 10-41 |
| 10.1.3     | Impacts on morphological and topological characteristics                               | 10-43 |
| 10.1.3.1   | Morphology                                                                             | 10-43 |
| 10.1.3.1.1 | Drilling preparation and mobilisation phase                                            | 10-44 |
| 10.1.3.1.2 | Exploration drilling operations phase                                                  | 10-44 |
| 10.1.3.1.3 | Demobilisation and abandonment phase                                                   | 10-47 |
| 10.1.3.2   | Landscape                                                                              | 10-48 |
| 10.1.3.2.1 | Drilling preparation and mobilisation phase                                            | 10-48 |

|                 |                                                                  |               |
|-----------------|------------------------------------------------------------------|---------------|
| 10.1.3.2.2      | Exploration drilling operations phase                            | 10-49         |
| 10.1.3.2.3      | Demobilisation and abandonment phase                             | 10-50         |
| <b>10.1.4</b>   | <b>Impacts on geological, tectonic, and soil characteristics</b> | <b>10-51</b>  |
| <b>10.1.4.1</b> | <b>Geology / marine geology</b>                                  | <b>10-51</b>  |
| 10.1.4.1.1      | Drilling preparation and mobilisation phase                      | 10-51         |
| 10.1.4.1.2      | Exploration Drilling Operations Phase                            | 10-52         |
| 10.1.4.1.3      | Demobilisation and abandonment phase                             | 10-53         |
| <b>10.1.4.2</b> | <b>Slope stability</b>                                           | <b>10-54</b>  |
| 10.1.4.2.1      | Drilling preparation and mobilisation phase                      | 10-54         |
| 10.1.4.2.2      | Exploration drilling operations phase                            | 10-55         |
| 10.1.4.2.3      | Demobilisation and abandonment phase                             | 10-56         |
| <b>10.1.4.3</b> | <b>Tectonics and seismicity</b>                                  | <b>10-57</b>  |
| 10.1.4.3.1      | Drilling preparation and mobilisation phase                      | 10-57         |
| 10.1.4.3.2      | Exploration drilling operations phase                            | 10-57         |
| 10.1.4.3.3      | Demobilisation and abandonment phase                             | 10-58         |
| <b>10.1.4.4</b> | <b>Soil</b>                                                      | <b>10-59</b>  |
| 10.1.4.4.1      | Drilling preparation and mobilisation phase                      | 10-59         |
| 10.1.4.4.2      | Exploration drilling operations phase                            | 10-60         |
| 10.1.4.4.3      | Demobilisation and abandonment phase                             | 10-61         |
| <b>10.1.4.5</b> | <b>Seabed – sediment</b>                                         | <b>10-61</b>  |
| <b>10.1.5</b>   | <b>Impacts on the biotic environment</b>                         | <b>10-69</b>  |
| <b>10.1.5.1</b> | <b>Terrestrial biotic environment</b>                            | <b>10-69</b>  |
| 10.1.5.1.1      | Terrestrial habitats – vegetation                                | 10-69         |
| 10.1.5.1.2      | Terrestrial fauna                                                | 10-69         |
| <b>10.1.5.2</b> | <b>Marine biotic environment</b>                                 | <b>10-69</b>  |
| 10.1.5.2.1      | Benthic fauna                                                    | 10-69         |
| 10.1.5.2.2      | Plankton                                                         | 10-79         |
| 10.1.5.2.3      | Marine fish fauna                                                | 10-82         |
| 10.1.5.2.4      | Marine mammals                                                   | 10-92         |
| 10.1.5.2.5      | Sea turtles                                                      | 10-104        |
| <b>10.1.5.3</b> | <b>Avifauna</b>                                                  | <b>10-114</b> |

| 10.3       | Assessment of cumulative/synergistic effects                                                                  | 10-251 |
| 10.3.1     | Commercial shipping, ferry services and international shipping                                                | 10-251 |
| 10.3.2     | Commercial fishing and fishing grounds                                                                        | 10-252 |
| 10.3.3     | Maritime tourism, recreational boating and cruises                                                            | 10-254 |
| 10.3.4     | Aquaculture activities                                                                                        | 10-254 |
| 10.3.5     | Submarine telecommunications and power cables                                                                 | 10-256 |
| 10.3.6     | Offshore oil and gas installations                                                                            | 10-258 |
| 10.3.7     | Offshore wind energy, ocean energy and other offshore renewable energy sources                                | 10-259 |
| 10.3.8     | Port activities in Igoumenitsa and land-based support base                                                    | 10-261 |
| 10.3.9     | Military exercise areas and restricted-access maritime zones                                                  | 10-261 |
| 10.3.10    | Combined synergistic effects on shared receptors                                                              | 10-261 |
| 10.4       | Assessment of transboundary environmental impacts                                                             | 10-262 |
| 10.4.1     | Geographical boundaries of the area of operation                                                              | 10-262 |
| 10.4.2     | Expected transboundary environmental impacts                                                                  | 10-263 |
| 10.4.2.1   | Seawater quality                                                                                              | 10-264 |

|          |                                 |        |
|----------|---------------------------------|--------|
| 10.4.2.2 | Seabed                          | 10-264 |
| 10.4.2.3 | Underwater noise                | 10-265 |
| 10.4.2.4 | Air quality                     | 10-266 |
| 10.4.2.5 | Maritime and air traffic        | 10-266 |
| 10.4.2.6 | Waste generation and management | 10-267 |
| 10.4.2.7 | Accidental hydrocarbon spill    | 10-267 |

## **11 Addressing environmental and social impacts** **11-1**

|          |                                                                            |       |
|----------|----------------------------------------------------------------------------|-------|
| 11.1     | Introduction                                                               | 11-1  |
| 11.2     | Proposed measures for normal / routine project activities                  | 11-1  |
| 11.2.1   | Proposed measures during drilling preparation and mobilisation phase       | 11-1  |
| 11.2.2   | Proposed Measures during Drilling Operations                               | 11-11 |
| 11.2.3   | Proposed measures during decommissioning phase – site restoration          | 11-21 |
| 11.3     | Proposed measures for non-routine operations                               | 11-24 |
| 11.3.1   | Contingency activities triggered by unfavourable operational circumstances | 11-24 |
| 11.3.2   | Proposed major accident prevention and response measures                   | 11-26 |
| 11.3.2.1 | Preventive and protective measures                                         | 11-26 |
| 11.3.2.2 | Emergency response measures                                                | 11-28 |
| 11.3.3   | Proposed measures to enhance climate change adaptation                     | 11-29 |

## **12 Environmental and Social Management and Monitoring** **12-1**

|          |                                                                                        |       |
|----------|----------------------------------------------------------------------------------------|-------|
| 12.1     | Health, Safety and Environmental Management System                                     | 12-2  |
| 12.1.1   | Scope                                                                                  | 12-3  |
| 12.1.2   | Project standards                                                                      | 12-3  |
| 12.1.3   | Setting goals and objectives                                                           | 12-4  |

| 12.2.1    | Introduction                                                            | 12-20 |
| 12.2.2    | Proposed environmental and social monitoring plan                       | 12-21 |

## 13 Elements of regulatory approval and proposed environmental terms for approval 13-1

|      |                                                                                                         |      |
|------|---------------------------------------------------------------------------------------------------------|------|
| 13.1 | Type and scale of activity                                                                              | 13-1 |
| 13.2 | Geographical location                                                                                   | 13-1 |
| 13.3 | Project classification                                                                                  | 13-3 |
| 13.4 | Project owner                                                                                           | 13-3 |
| 13.5 | Institutionally designated key characteristics of the project area and environmental sensitive features | 13-3 |

|          |                                                                                                                                                            |       |
|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------|-------|
| 13.5.1   | Spatial planning and land uses                                                                                                                             | 13-3  |
| 13.5.2   | Land uses                                                                                                                                                  | 13-4  |
| 13.5.3   | Environmental sensitivity features of the project area                                                                                                     | 13-4  |
| 13.5.3.1 | National protected areas                                                                                                                                   | 13-4  |
| 13.5.3.2 | International protected areas                                                                                                                              | 13-4  |
| 13.5.3.3 | Fisheries restricted areas (FRAs)                                                                                                                          | 13-5  |
| 13.5.3.4 | Forests and forested areas                                                                                                                                 | 13-5  |
| 13.5.3.5 | Water management plans                                                                                                                                     | 13-5  |
| 13.5.3.6 | Flood risk management plans                                                                                                                                | 13-6  |
| 13.5.4   | Specific Emission Limit Values for Pollutant Loads and Concentrations According to Applicable Regulations                                                  | 13-6  |
| 13.6     | Terms, measures and restrictions to be accounted for mitigation (prevention – minimization – remediation – restoration) of potential environmental impacts | 13-7  |
| 13.6.1   | General terms                                                                                                                                              | 13-7  |
| 13.6.2   | Mobilization and drilling operations                                                                                                                       | 13-9  |
| 13.6.2.1 | Air quality, climatic and bioclimatic characteristics                                                                                                      | 13-9  |
| 13.6.2.2 | Morphology and landscape                                                                                                                                   | 13-10 |
| 13.6.2.3 | Waste and wastewater management                                                                                                                            | 13-11 |

# 1 Introduction

---

## 1.1 Project title

---

The project is planned within the framework of the overall Exploration and Production (E&P) Programme of the Concession Area of Block 2.

The programme is included in the respective Strategic Environmental Assessment (SEA) for E&P in the Ionian Sea (covering the eleven (11) Concession Blocks including also Mesiniakos and Lakonikos Gulfs) that was prepared in 2016 (HCMR) and a respective approval was granted in 2017 (DIPA/MoEE 30373/3.7.2017). The programme consists of four (4) phases:

- **Phase 1 – Prospecting:** Identification of hydrocarbons or assessment of potential to locate hydrocarbons by any suitable method other than drilling. Typically involves a combination of geophysical and geological activities including seismic surveys, geological and geochemical sampling, electromagnetic surveys, and remote sensing.
- **Phase 2 – Exploration:** Promising areas are explored, initially with geophysical surveys of the seabed, mainly seismic, to identify targets, i.e. suitable tectonic and/or stratigraphic structures in the subsoil, which may have acted as traps for liquid and gaseous hydrocarbons. One or more exploration wells are drilled in the targets. In case of finding hydrocarbons, based on the drilling and production test data, the productive zones (reservoirs) and the exploitable reserves of each field are determined. In case of failure to identify exploitable reserves, the next phase of development is not implemented.
- **Phase 3 – Development and Production:** The extraction of hydrocarbons is carried out by exploiting the wells of the previous stage or by drilling new ones, as well as the processing, storage and transportation activities of these and their by-products to loading facilities. This phase includes the implementation of all necessary infrastructure, such as processing, temporary storage and loading facilities, a network of transport pipelines, etc. The processing of the extracted hydrocarbons to make them marketable does not include refining
- **Phase 4 – Decommissioning and rehabilitation:** After the completion of the exploitation of a hydrocarbon field, the phase follows of sealing the pipelines of all exploration and production wells, dismantling and removing all surface installations and production, storage and transportation infrastructure, and the restoration of the area.

The Concession Area of Block 2, which refers to one of the abovementioned eleven (11) Offshore concession Blocks is presented in the following map as it currently stands.

**Figure 1-1: Concession area**

The Concession Area of Block 2 is governed by a hydrocarbons lease agreement with the Hellenic Republic. The Lease Agreement (the “Lease Agreement”), dated 31 October 2017, grants exploration and exploitation rights for Block 2. The Lease Agreement was ratified by the Hellenic Parliament under Law 4525/2018 and published in Government Gazette No. 47/A/15.03.2018.

The Exploration phases of the programme, as described in the Lease Agreement, are presented in the following Table.

**Table 1-1: Exploration schedule**

| MINIMUM WORKS                 | PHASE 1<br>YEAR 1 TO YEAR 3                                         | PHASE 2<br>YEAR 4 TO YEAR 5                | PHASE 3<br>YEAR 6 TO YEAR 8   |
|-------------------------------|---------------------------------------------------------------------|--------------------------------------------|-------------------------------|
| <b>Firm activities</b>        |                                                                     |                                            |                               |
| Seismic acquisition           | Acquisition & Processing of 1,800 km 2D seismic data                | Re-evaluation of seismic data              | Re-evaluation of seismic data |
| Re-evaluation of seismic data | Magnetic & gravity survey (if possible, during seismic acquisition) | -                                          | -                             |
| Drilling                      | -                                                                   | One well                                   | One well                      |

| Seismic acquisition    | -                                                             | Acquisition of 3D seismic<br>data (extent depending on<br>2D and well results) | -                                                                |

*Note: Following HEREMA's approval, the original Phase 1 commitment for 2D seismic acquisition was fulfilled through the acquisition and processing of 3D seismic data, providing a higher-resolution dataset over the area of interest.*

In the framework of the exploration program, Phase 1 has been completed, with the Acquisition & Processing of 3D seismic data, bringing forward the additional contingent task which was initially part of Phase 2. In agreement with HEREMA, the commitment to execute a 2D seismic data program during Phase 1 was replaced with the acquisition of 3D seismic data.

As per the contractual and legal obligations of the operator, prior to initialization of the exploration activities including drilling of exploration wells, an Environmental and Social Baseline Study (ESBS) for Phase 2 activities, has been submitted to HEREMA (ref. number: 36594).

The framework of the Environmental and Social Baseline Study, as indicated in the Lease Agreement (Article 12.14), requires the presentation and assessment of the current status of environmental parameters and resources, in the period prior to the initialisation of exploration activities. Since the overall exploration program is to be executed in distinct phases (differentiated in relation to time, place and type of activities), the Baseline Report specified in the Lease Agreement, is to be carried out in respective stages to include information about the relevant "wider" and "immediate" study area. The first (1st) stage Baseline Report already prepared at earlier stages, presented existing E&S information for the wider study area which, according to the Approval of the SEA Study and included the entire Exploration and Exploitation Concession Area of Block 2 (since no immediate areas of operations were specified at the given time).

Following the above, the seismic survey activities were supported by the environmental and social documentation prepared for Block 2. The Environmental and Social Baseline Study (ESBS) / Environmental Baseline Report (EBR) established the pre-operational baseline conditions of the concession area and its wider area of influence, covering the offshore Block 2 area, an additional buffer zone and the closest onshore administrative unit, namely the Corfu Regional Unit. This baseline provided the reference framework for identifying sensitive environmental and social receptors prior to the commencement of exploration activities.

In parallel, the Environmental Action Plan (EAP) prepared for the offshore seismic acquisition activities set out the applicable regulatory and management framework for the surveys. It was developed to meet the requirements of the Lease Agreement and the approved Strategic Environmental Assessment, (SEA) and included the description of the seismic activities, the assessment of potential environmental and social impacts, specific mitigation measures, residual impact evaluation, environmental risk analysis and the Environmental and Social Management Plan framework. Therefore, the completed 3D seismic acquisition was carried out within an established framework aimed at avoiding, minimizing and monitoring potential impacts on marine fauna, water quality, maritime/fishing activities and other sensitive receptors.

Consequently, the following environmental related work has been previously prepared in the framework of the Block's exploration activities:

- ESBS for the whole Block 2 (Rina, 2017)
- ESBS and EAP for the 2D&3D Seismic surveys campaign for the areas of operations (Rina, 2020)

It is noted that the description of the environmental and social conditions with regards to the wider area is complementary for each stage of ESBS, since environmental information is to be updated and integrated over time, to enable the recording of any development trends. The description of the conditions of the immediate area strictly depends on the specific area where the exploration activities and operations are to be carried out.

Currently, the prospecting activities have been completed and also supplemented by the contingent works of 3D seismic data (as part of Phase 1), and thus, the Operator (Energean Hellas Ltd), together with its partners ExxonMobil Exploration and Production Greece (Crete) BV and HelleniQ Upstream West Kerkyra SA, intends to undertake the Exploration Phase activities, i.e. the drilling of a single offshore exploration well, named Asopus 1, in Block 2 of the Ionian Sea, offshore western Greece, in 2027, which is the objective of the present ESIA.

The title of the present project is:

**Environmental and Social Impact Assessment (ESIA) for the Hydrocarbon Exploration Program –  
Exploration Well Asopus-1 in Block 2 – Ionian Sea**

The Environmental and Social Impact Assessment (ESIA) of the Project is being prepared in accordance with the applicable provisions of Greek legislation and the relevant European Directives.

The overall effort has been further strengthened by the preparation of a detailed Environmental and Social Baseline Study (ESBS) which updates the previous studies prepared to date and further focuses on the specific targeted area for exploratory drilling with results and conclusions obtained from field geophysical and environmental surveys. The ESBS report is annexed in the current ESIA, whereas the main conclusions for each environmental and social parameter are presented in the ESIA's baseline chapter.

## 1.2 Project type and size

The Project comprises the drilling of one offshore exploration well (Asopus-1) within Block 2 in the Ionian Sea. The objective of the proposed activity is to evaluate subsurface geological formations and assess the potential presence of hydrocarbons. The well will be drilled using a mobile offshore drilling unit (MODU), specifically the Stena DrillMAX drillship, which is purpose designed for deep water drilling operations, utilising shore base for logistics support (Igoumenitsa Port) and Corfu Airport (CFU) for transport.

The proposed activity is temporary and limited in scope, comprising the drilling, evaluation, and subsequent plugging and abandonment of the exploration well in accordance with applicable regulatory requirements and industry good practices.

No oil or gas production or well testing is planned as part of this project and thus of the present ESIA. If hydrocarbons are identified, any further appraisal or development activities would be subject to separate permitting and environmental assessment processes in line with all respective EU and National legislative frameworks.

## 1.3 Geographic location and administrative dependence of the project

### 1.3.1 Project location

#### 1.3.1.1 Well location and coordinates

The proposed Asopus-1 exploration well is located within the Block 2 license area in the Greek Exclusive Economic Zone (EEZ) in the northwestern Ionian Sea. It is approximately 44.3 km (23.9 nautical miles) offshore Othonoi Island (Figure 1-2), approximately 3.2 km (1.7 nautical miles) from the Italian Exclusive Economic Zone (EEZ) and in water depths of approximately 840 m. There are no islands, coastal features, or fixed subsea installations in the immediate vicinity of the well location.

The location was selected based on technical and operational considerations, including drillship capability, well design requirements, and logistical feasibility within the Block 2 license area.

**Figure 1-2: Location of proposed Asopus-1 exploration well**

The indicative well location, including geographic coordinates and water depth, is provided in Table 1-2. The coordinates represent the planned seabed location of the well and the anticipated bottom hole position for the exploration programme.

Coordinates are provided using the World Geodetic System 1984 (WGS 84) datum, which is the standard reference system used for offshore operations in the region. The location lies within UTM Zone 34N.

**Table 1-2: Coordinates and Water Depth of proposed Asopus-1 exploration well**

| WELL     | LEASE AGREEMENT | LATITUDE         | LONGITUDE        | WATER DEPTH |
|----------|-----------------|------------------|------------------|-------------|
| Asopus-1 | Block 2         | 39° 37' 25.92" N | 18° 57' 28.51" E | ~ 840 m     |

Minor adjustments to the final well position may occur during detailed engineering or operational planning. However, any such adjustments would remain within the defined operational area, and the design envelope assessed in this ESIA. The final well location will be confirmed prior to drilling as part of the Notification of Well Operations (NoWO) submitted to the competent authority.

Moreover, in the following tables, the coordinates of the onshore logistics support base as well as Corfu Airport (CFU) are provided.

**Table 1-3: Coordinates of the proposed logistics support base**

| ONSHORE LOGISTICS SUPPORT BASE | LATITUDE (WGS84)  | LONGITUDE (WGS84) | X (ΕΓΣΑ 87) | Y (ΕΓΣΑ 87)  |
|--------------------------------|-------------------|-------------------|-------------|--------------|
| Igoumenitsa Port (Area 1)      | 39 ° 29' 04.24" N | 20 ° 15' 19.01" E | 177.765,45  | 4.376.956,26 |
| Igoumenitsa Port (Area 2)      | 39 ° 29' 06.29" N | 20 ° 15' 34.34" E | 178.134,34  | 4.377.004,21 |

**Table 1-4: Coordinates of the proposed aviation logistics base (CFU)**

| AVIATION LOGISTICS BASE (CFU)     | LATITUDE (WGS84) | LONGITUDE (WGS84) | X (ΕΓΣΑ 87) | Y (ΕΓΣΑ 87)  |
|-----------------------------------|------------------|-------------------|-------------|--------------|
| Corfu International Airport (CFU) | 39 ° 36' 07" N   | 19 ° 54' 42" E    | 148.794,88  | 4.391.282,96 |

### 1.3.1.2 Safety zone

During drilling operations, a temporary 500 m safety zone will be established around the drillship at the Asopus-1 well location to ensure navigational safety and safe conduct of offshore operations. Under international maritime regulations, a mobile offshore drilling unit (MODU) engaged in drilling is classified as a vessel restricted in its ability to maneuver, and other vessels are required to keep clear. In addition, Greek legislation designates offshore drilling units as installations subject to a mandatory 500 m safety zone, within which unauthorized access is prohibited. While the safety zone may temporarily restrict access to other marine users, the affected area and duration are limited. The establishment of the safety zone will be communicated through official maritime notifications, including NAVTEX messages and Notices to Mariners, issued by the Hellenic Coast Guard. The safety zone will be monitored throughout the drilling campaign, and support vessels may be used to assist with safety zone awareness and compliance, where necessary. The 500 m safety zone will apply only for the duration of drilling operations while the drillship is on location. Once drilling is completed and the drillship has departed the site, the safety zone will be removed, and normal maritime activities may resume. While the safety zone may result in the temporary displacement of other marine users, the affected area is limited and represents a small portion of the overall Block 2 licensed area.

### 1.3.1.3 Administrative dependence

On the administrative level, the Block 2 covers the area located within the Regional Unit (RU) of Corfu of the Ionian Islands Region (IIR), while its Western limit follows the boundary line between the continental shelf areas of Italy and Greece according to the respective agreement of May 24, 1977 and reaffirmed/extended by the 2020 Greece-Italy Agreement on the Delimitation of their Respective Maritime Zones<sup>1</sup>, which establishes this boundary line in accordance with the principle of the median line.

<sup>1</sup> Agreement between the Hellenic Republic and the Italian Republic on the delimitation of their respective maritime zones, Athens, 9 June 2020. United Nations Treaty Series, No. 57024

Administratively, the Port of Igoumenitsa is located within the Municipality of Igoumenitsa, Regional Unit of Thesprotia, in the Region of Epirus. Its port facilities are operated by Igoumenitsa Port Authority SA (IPA SA), which has the exclusive right to use and operate the Port of Igoumenitsa under a concession agreement with the Hellenic Republic.

Corfu International Airport (CFU) “Ioannis Kapodistrias” is located on Corfu Island, within the Municipality of Central Corfu and Diapontia Islands, Regional Unit of Corfu, in the Ionian Islands Region. The airport land and infrastructure are owned by the Hellenic State, while its operation and management are carried out by Fraport Greece under the regional airports’ concession scheme.

**Figure 1-3: Area of Operations**

#### 1.3.1.4 Onshore facilities location

The Project will utilise two existing onshore support facilities for logistics and aviation activities:

- (i) an onshore logistics / supply base located within the Port of Igoumenitsa (mainland Greece); and
- (ii) Corfu International Airport (CFU), which will be used as the helicopter operations base for personnel transfers between the onshore environment and the Mobile Offshore Drilling Unit (MODU).

The Igoumenitsa onshore logistics / supply base will operate as the principal marine logistics hub. Activities at the supply base will not extend beyond those typically associated with established offshore support ports. It will be used for the storage, staging, and loading or unloading equipment, materials, consumables, and

limited wastes associated with the Asopus-1 drilling campaign. No new marine infrastructure, dredging, reclamation, quay construction, or shoreline modification is proposed.

The location is suited to the offshore operational area via established vessel routes; indicative distances between the offshore site and Igoumenitsa Port are provided in Table 1-5. No new port infrastructure, dredging or shoreline works are required for the Project.

**Figure 1-4: Port of Igoumenitsa – location of onshore logistics / supply base (Google Maps satellite imagery)**

Figure 1-5 illustrates the location of the shore base within the Igoumenitsa port area, highlighting the defined operational footprint and its proximity to existing port infrastructure and the dedicated quayside.

The shore base incorporates zoning to minimise environmental risks, including spill sensitive quayside areas, controlled storage zones, quarantine areas, laydown areas and defined traffic corridors.

Figure 1-5: Igoumenitsa Port Orthophoto and Shore Base Location

Corfu International Airport (CFU) will provide the aviation logistics hub for routine crew transfers (and, if required, emergency response such as medical evacuation). Helicopter activities will use existing airport infrastructure and established aviation procedures. They will not alter the operational role, capacity, or regulatory status of Corfu International Airport. Any temporary project-specific arrangements (e.g., operational areas within the airport) will be accommodated within the existing airport footprint and will not require permanent expansion or modification of airport facilities. Indicative distances between the offshore site and Corfu Airport are provided in Figure 1-6.

Figure 1-6: Corfu International Airport (CFU) – helicopter operations base location Google Maps satellite imagery)

## 1.4 Transboundary context

The proposed Asopus-1 exploration well is located within the Greek Exclusive Economic Zone (EEZ) in Block 2 in the Ionian Sea, near the agreed maritime boundary between Greece and Italy. The relative location of the well site with respect to international maritime boundaries, coastal landfalls, and key logistical points is summarised in Table 1-5

The distances are derived from proximity to legally defined maritime boundaries, straight-line (great-circle) measurements for aviation routes and established commercial navigation routes for marine logistics.

**Table 1-5: Relevant Distances from the Proposed Site**

| DESTINATION                  | DISTANCE FROM SITE |         | TECHNICAL BASIS                                                             |
|------------------------------|--------------------|---------|-----------------------------------------------------------------------------|
| <i>Italian EEZ border</i>    | 3.16 km            | 1.71 nm | Shortest distance to the 1977/2020 boundary line segment (P15–P16)          |
| <i>Closest Italian coast</i> | 54.9 km            | 29.7 nm | To Punta Ristola (Santa Maria di Leuca), the nearest Italian landfall       |
| <i>Closest Greek Island</i>  | 44.3 km            | 23.9 nm | To the western shore of Othonoi Island                                      |
| <i>Closest Point (Corfu)</i> | 60.1 km            | 32.4 nm | To Cape Drastis (Northwest Corfu)                                           |
| <i>Igoumenitsa Port</i>      | 129.4 km           | 69.9 nm | Via North Corfu Channel navigation route, assuming vessel safety clearances |
| <i>Corfu Airport</i>         | 81.9 km            | 44.2 nm | Direct flight path (Great Circle) for a twin-engine medium helicopter       |

The well location lies approximately 3.16 km (1.71 nm) east of the Greece–Italy EEZ boundary. The closest Italian mainland coast is located at Punta Ristola (Apulia), approximately 54.9 km (29.7 nm) from the well, while the nearest Greek land is Othonoi Island (Diapontia island group), approximately 44.3 km (23.9 nm) from the well location.

## 1.5 Project classification

According to Ministerial Decision DIPA/37674/10-8-2016, as amended by Ministerial Decisions 2307/2018 and YPEN/DIPA/17815/1069/2022 (government Gazette 841/B' 24.2.2022) and currently in force, the main drilling activity in Asopus-1 falls under Category 5 “Mining and similar activities”, Serial Number 7 “Extraction of hydrocarbons and exploratory drilling in search of hydrocarbons” and is included in Subcategory A1 since all works of this activity are classified as such.

In addition, the onshore support facilities in Igoumenitsa Port, fall under Category 3 “Port infrastructure”, Serial Number 2a “Ports and port facilities for support of industrial activities (e.g. support of industrial facilities, fuel handling, petrochemicals or chemicals, toxic and harmful substances, quarry products, etc)” and is classified under Subcategory A2.

**Table 1-6: Project components and environmental classification**

| CATEGORY | PROJECT COMPONENT                                                                         | GROUP | NO | PROJECT CATEGORY                                                                                                                                                                                                              | CLASSIFICATION                                  |
|----------|-------------------------------------------------------------------------------------------|-------|----|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------|
| Main     | Asopus-1 O&G offshore exploration well drilling                                           | 5th   | 7  | Mining activities<br>Extraction of hydrocarbons and exploratory drilling in search of hydrocarbons                                                                                                                            | A1                                              |
| Side     | Onshore support port facilities, Igoumenitsa port <sup>2</sup>                            | 3rd   | 2a | Port infrastructure<br>Ports and port facilities for support of industrial activities (e.g. support of industrial facilities, fuel handling, petrochemicals or chemicals, toxic and harmful substances, quarry products, etc) | A2<br>(for support of vessels of length L<150m) |
| Side     | Support for helicopter personal transport within Corfu International Airport <sup>3</sup> | -     | -  | NOT CLASSIFIED<br>Classified only as sole infrastructure (not within other infrastructure)<br>Temporary facilities and transport operations fall under existing Environmental Permit of Corfu International Airport           |                                                 |

Since the classification of all project components follows the classification of the project component that is classified at the highest category, the overall project is classified under subcategory A1.

Works and activities that are classified under subcategory A1 are likely to have significant impacts to the environment and therefore:

- A detailed Environmental Impact Assessment (EIA) is required in accordance with the provisions of JMD 170225/2014 as currently stands.
- According to L. 4014/2011, the competent authority for the issuance of the respective environmental permit is the Ministry of Environment and Energy (MoEE/YPEN) and in particular the Department of Environmental Permitting (DIPA).
- The road map for the submission, evaluation, consultation and final approval of environmental terms, are prescribed in Article 3 of L.4014/2011, as currently stands.
- The consulted authorities to provide their comments according to their thematic specialization is defined in JMD 1649/45/2014 titled: "Specification of the procedures for obtaining opinions and informing the public and the participation of the interested public in the public consultation during the environmental permitting of projects and activities of Category A, pursuant to the decision of the Ministry of Environment, Energy and Climate Change No. 1958/2012 (Government Gazette 21/A), in accordance with the provisions of Article 19, paragraph 9 of Law 4014/2011 (GG 209/A), as well as any other relevant detail".

<sup>2</sup> The overall onshore operations will be within the premises of Igoumenitsa Port, in a leased area by the Project Operator, i.e. Energean. Although the operations are in line with the existing Environmental Permit of the Igoumenitsa Port, the specialized operations are included in the present ESIA as they will be under the direct management of Energean as lessee of the Port's area.

It is considered best practice to include the impact assessment of the said operation within the present ESIA for completeness of the environmental and social impact assessment of the project in its whole footprint (both offshore and onshore).

<sup>3</sup> The support that will be provided through the Ioannis Kapodistrias International Airport (Corfu) – CFU, is not included in the impact assessment since it will not be under Energean's management, but in the contrary it will be a third-party transport facility that will be utilised solely for logistical support purposes and does not form part of the Project footprint. No Project-related construction, modification, expansion, dedicated infrastructure, land acquisition, or operational changes are proposed within the airport, nor is the Project expected to influence the airport's capacity, function, management arrangements, or existing patterns of use.

- The Environmental Impact Assessment (EIA) will include Forms T and Y, which define the identity of the activity subject to environmental permitting, as well as information related to the environmental permitting activity, in accordance with Ministerial Decision 167563 (GG 964/B/19-04-2013), titled: "Specification of the procedures and specific criteria for the environmental permitting of projects and activities under Articles 3, 4, 5, 6 and 7 of law 4014/2011, as provided in Article 2, paragraph 13, the specific forms for the aforementioned procedures and any other matter related to these procedures".

The environmental permitting process for the Project is governed by law 4014/2011, as amended by L. 4685/2020, titled: "Modernization of environmental legislation, transposition into Greek law of Directives 2018/844 and 2019/692 of the European Parliament and of the Council and other provisions" (GG 92/A/7.5.2020). The content and level of detail of the Environmental Impact Assessment (EIA) are defined in Joint Ministerial Decision (JMD) 170225/2014.

Moreover, for the present ESIA's compilation, all latest and up to date modification / additions to the EIA process and requirements listed below, have been considered:

- MD 5688/2018: "Amendment of the annexes of Law 4014/2011 (GG 209/A) in accordance with Article 36A of this law, in compliance with Directive 2014/52/EU "amending Directive 2011/92/EU regarding the assessment of the effects of certain public and private projects on the environment" of the European Parliament and of the Council of April 16, 2014 (GG 988/B/2018)"
- MD 1915/2018: "Amendment of the MD numbers 48963/2012 (B' 2703) and 170225/2014 (B' 135), which were issued under the authorization of Law 4014/2011 (GG 209/A), in compliance with Directive 2014/52/EU "amending Directive 2011/92/EU regarding the assessment of the effects of certain public and private projects on the environment" of the European Parliament and of the Council of April 16, 2014 (GG 304/B/2018)".
- MD 143898/9866/2024: "Amendment of contents of the environmental impact assessment (EIA) studies, for projects and activities environmental permitting of category A of L.4014/2011 aligning with article 18 of the National Climate Law (L.4936/2022).

## 1.6 Project operator and co-venturers

### 1.6.1 Background

Offshore Block 2 is in the northwestern Ionian Sea, off the coast of western Greece, and is governed by the Lease Agreement with the Hellenic Republic. The Lease Agreement, dated 31 October 2017, grants exploration and exploitation rights for Block 2 and was signed by the Hellenic Republic, represented by the Minister of Environment and Energy, and initially by Total E&P Greece BV ("Total"), Edison International SpA ("Edison"), and Hellenic Petroleum Société Anonyme ("HELPE"). The agreement was ratified by the Hellenic Parliament under Law 4525/2018 and published in Government Gazette No. 47/A/15.03.2018.

Under the original lease structure, Total held a 50% participating interest and acted as Operator, while Edison and HELPE each held 25% participating interests as non-operating co-venturers. The lease structure subsequently evolved through several consecutive transactions:

- HELPE transferred its entire 25% participating interest in the Lease Agreement, along with all associated

rights and obligations, to its affiliate Hellenic Petroleum Exploration and Production of Hydrocarbons West Kerkyra S.A. (later renamed “Helleniq Upstream West Kerkyra Single Member Societe Anonyme” or “Helleniq”). As a result, Helleniq became a co-lessee with a 25% interest in the Lease Agreement.

- Edison transferred its entire 25% participating interest in the Lease Agreement, with all associated rights and obligations, to Energean International E&P SpA (formerly Edison International E&P SpA, an Edison affiliate). Energean International E&P SpA then became co-lessee with a 25% interest in the Lease Agreement.
- Total transferred its entire 50% participating interest in the Lease Agreement, including all rights and obligations, to Energean Hellas Ltd. Energean Hellas Ltd. then became co-lessee with a 50% interest and was appointed Operator in accordance with the Lease Agreement.
- Energean International E&P SpA transferred its entire 25% participating interest in the Lease Agreement, with all rights and obligations, to Energean Hellas Ltd. As a result, Energean Hellas Ltd. increased its participating interest in the Lease Agreement to 75%.
- Energean Hellas Ltd transferred part of its participating interest (45%) in the Lease Agreement with all rights and obligations to ExxonMobil Exploration and Production Greece (Crete) B.V. and Helleniq Upstream West Kerkyra S.A. transferred part of its participating interest (15%) in the Lease Agreement with all rights and obligations to ExxonMobil Exploration and Production Greece (Crete) B.V.

The current participating interests in Block 2 are:

- ExxonMobil Exploration and Production Greece (Crete) B.V. (ExxonMobil): 60%
- Energean Hellas Ltd. (Energean): 30%, also maintaining the operatorship
- Helleniq Upstream West Kerkyra S.A. (HELLENiQ ENERGY): 10%

(collectively, the “Co-Lessees”)

The Lease Agreement became effective on 15 March 2018, initiating the First Phase of the Exploration Stage with an initial term of three years, set to expire on 14 March 2021. Subsequently, five years of consecutive extensions were granted, extending the First Phase to 14 March 2026. In addition, the Basic Exploration Stage, with an eight-year duration, was scheduled to expire on 15 March 2026.

After the Co-Lessees submitted an application, the Cabinet of Ministers granted a special extension of the Basic Exploration Stage on 9 March 2026. The Council of Ministers approved a total extension of five years (14 March 2031): three years for the second phase and two years for the third phase. This allows the Co-Lessees to enter the Second Phase of the Basic Exploration Stage, as outlined in paragraph 2.1 of Article 2 of the Lease Agreement. The first exploration well, as required by the Minimum Work Program in paragraph 3.2 of article 3, must be drilled within 18 months from the effective date of the Cabinet’s decision.

On 13 March 2026, the Co-Lessees notified HEREMA of their entry into the Second Phase, which will last three years and expire on 14 March 2029.

## 1.6.2 Operator and co-venturers profiles

Energean Hellas Ltd is part of the Energean group of companies, an independent exploration and production group with a strategic focus on the Mediterranean region. Its portfolio includes, or has included, upstream activities in Greece, Israel, Italy, Croatia and Egypt, providing a strong regional perspective relevant to

offshore Greece. Energean has longstanding upstream experience in Greece and significant offshore operating experience in the Eastern Mediterranean, including operated gas developments offshore Israel. In Block 2, Energean participates through Energean Hellas Ltd (Energean), which, as above described, holds a 30% participating interest and acts as Operator during the exploration phase, with responsibility for delivering the agreed exploration obligations on behalf of the Co-Lessees.

ExxonMobil Exploration and Production Greece (Crete) BV (ExxonMobil) is part of the ExxonMobil group and brings extensive global experience in offshore exploration and field development, including deepwater and frontier projects. In Block 2, ExxonMobil holds the largest participating interest at 60% following the 2026 farm-in transaction. During the exploration phase, ExxonMobil participates as a non-operating co-venturer and does not hold operational responsibility for exploration activities.

HelleniQ Upstream West Kerkyra S.A. (HelleniQ) is the upstream subsidiary of HELLENiQ ENERGY, a leading Greek energy group with longstanding involvement in the national hydrocarbons sector. HelleniQ provides continuity from the earlier licence structure and participates in Block 2 as a non-operating co-venturer with a 10% participating interest.

### 1.6.3 Operator credentials – energean

---

Since 2019, Energean has established demonstrable offshore well operator credentials through the planning and execution of multiple offshore drilling campaigns with drillships in the Eastern Mediterranean and North Africa. These campaigns covered exploration, appraisal, and development wells in deepwater and ultra-deepwater environments, conducted in accordance with prevailing safety, environmental and regulatory standards. This operating track record provides a robust basis for the proposed Asopus-1 offshore exploration well in Block 2.

This experience demonstrates Energean's ability to plan, manage and execute offshore drilling activities safely and efficiently. Core competencies include drillship selection and contracting, well design, drilling operations, marine and aviation logistics, contractor coordination, regulatory engagement and post-well close-out.

#### 1.6.3.1 Operated offshore drilling experience – Israel

---

Energean has conducted multiple offshore drilling campaigns in Israel, using modern drillships in deepwater environments under the oversight of the Israeli Ministry of Energy and Infrastructure. These campaigns represent the most directly relevant precedent for the Asopus-1 Project in terms of offshore operational complexity and regulatory requirements.

In 2019, Energean deployed the Stena DrillMAX drillship to drill three development wells and one exploration well (Karish North). The campaign was completed safely and in full compliance with applicable regulatory and environmental requirements, demonstrating Energean's capabilities in offshore drilling operations, environmental management, marine logistics and contractor coordination in the Eastern Mediterranean.

In 2022, Energean executed a further offshore drilling campaign using the Stena IceMAX drillship. This six-well campaign comprised development, appraisal and exploration activities, including:

- one development well, involving the re-entry, sidetrack and completion of the previously drilled Karish North well;
- one appraisal well (Karish Main-04); and
- four exploration wells across multiple licence areas offshore Israel.

The 2022 campaign required extended drillship mobilisation, coordination of multiple well objectives and engagement with several regulatory authorities. It was executed using Energean's established health, safety and environmental management systems, further demonstrating the company's ability to manage complex, multi-well offshore drilling campaigns safely and consistently across different licence areas.

In 2026, Energean is conducting a two-well development drilling campaign offshore Israel as part of the Katlan field development, utilising the Saipem Santorini drillship, further reinforcing its ongoing operational presence and experience in the region.

Taken together, the 2019, 2022, and 2026 Israeli offshore drilling campaigns demonstrate Energean's consistent, operator-led offshore drilling capability, including the safe execution of development, appraisal and exploration wells using different drillships, and the effective management of environmental and safety risks in deepwater offshore settings.

The proposed Asopus-1 well therefore represents a continuation of established offshore drilling activities previously undertaken by Energean as Operator, using comparable drilling units and operational systems. The same drillship used in the Israel 2019 campaign, Stena DrillMAX, is proposed for the drilling of the Asopus-1 exploration well in Block 2, building on its proven operational performance.

### 1.6.3.2 Operated offshore drilling experience – Morocco

Energean has also acted as operator of offshore licences in Morocco, extending its offshore drilling activities into a different regulatory and operational environment. In 2024, Energean drilled one offshore appraisal well using the Stena Forth drillship. This activity demonstrates Energean's ability to safely mobilise and operate a drillship, manage offshore logistics and contractors, engage with regulatory authorities and execute drilling operations in accordance with approvals and international safety and environmental standards in a noncore jurisdiction.

### 1.6.3.3 Operated offshore drilling experience – Prinos field in Greece

Energean has a long operational history in Greece through the Prinos offshore development, located in the North Aegean Sea near Kavala. Activities have included offshore drilling operations, well interventions, logistics coordination, marine support, and environmental management. To date, Energean has drilled three wells and conducted seventeen well intervention campaigns at Prinos, maintaining an excellent HSE performance record in line with its HSE and environmental management systems and applicable Greek and EU regulatory requirements, with safe activities adjacent to areas with extensive tourist and fishing activity. This experience demonstrates familiarity with Greek and EU regulatory requirements, offshore operations in Greek waters, and the management of drilling, intervention, and associated environmental risks through established HSE and environmental management systems.

#### 1.6.3.4 Non-Operated offshore exploration experience

In addition to its operated activities, Energean has participated as a non-operating partner in offshore exploration wells led by international oil and gas companies. This includes participation in the Orion-1X offshore exploration well in Egypt, operated by a subsidiary partly owned by Eni, and involvement as a joint-venture partner in the Isabella offshore exploration and appraisal programme in the UK Continental Shelf, operated by a TotalEnergies subsidiary. Although Energean was not the designated operator for these wells, its role involved subsurface evaluation, well planning, drilling programme review, regulatory engagement and post-well technical assessment within established joint-venture governance structures. These activities complement Energean's operated drilling record by demonstrating offshore exploration experience both as an operator and an active technical partner.

#### 1.6.3.5 Summary and relevance to Asopus-1

Since 2019, Energean has conducted multiple drillship-based offshore well operations across several jurisdictions, including four wells in Israel in 2019, six wells in Israel in 2022, and an appraisal well in Morocco in 2024. Collectively, these activities demonstrate Energean's established experience in drillship-based offshore operations, encompassing development, appraisal and exploration wells, delivered with a consistent emphasis on safety, environmental management and regulatory compliance. This operating history supports the conclusion that the proposed Asopus-1 exploration well will be managed by an operator with proven deepwater offshore drilling capability.

#### 1.6.4 Project owner representatives

The person responsible for the ESIA on behalf of the Project Owner is:

**Table 1-7: Details of the project owner**

| COMPANY         | ENERGEAN                                                        |                                                                                       |
|-----------------|-----------------------------------------------------------------|---------------------------------------------------------------------------------------|
| Address:        | 32 Kifisias Avenue, 151 25 Maroussi                             |  |
| Telephone:      | +30 210 8174200                                                 |                                                                                       |
| Email:          | pkaratokis@energean.com                                         |                                                                                       |

## 2 Non-technical summary

---

### 2.1 Key project details

#### 2.1.1 Background

---

This Project and its associated activities form part of the overall Hydrocarbon Exploration and Production (E&P) Programme for the Concession Area, Block 2. The Block 2 Concession Area is governed by a hydrocarbon lease agreement with the Hellenic Republic. The Lease Agreement (the 'Lease Agreement'), dated 31 October 2017, grants exploration and production rights for Block 2. The Lease Agreement was ratified by the Hellenic Parliament under Law 4525/2018 and published in the Government Gazette No. 47/A/15 March 2018.

This programme has been assessed as part of the Strategic Environmental Assessment (SEA) process for the exploration and production (E&P) of hydrocarbons in the Ionian Sea, through which the eleven (11) Concession Blocks, including the Messinian and Laconic Gulfs. To fulfil the objectives of the EIA process, a Strategic Environmental Impact Assessment (SEIA) was prepared in 2016 by the Hellenic Centre for Marine Research (ELKETHE, 2016), for which the relevant approval was issued in 2017 (DIPA/YPEN 30373/3.7.2017).

The programme, as set out in the aforementioned EIA, consists of four (4) phases.

It should be noted that a description of the environmental and social conditions relating to the wider area is necessary for each stage of the programme's implementation. In particular, an Environmental and Social Baseline Study (ESBS) is being carried out, as environmental information is updated and incorporated over time to enable the identification of any trends. The description of conditions in the immediate vicinity depends entirely on the specific area where the research activities and works are to be carried out.

At present, exploration activities have been completed and have also been supplemented by the associated 3D seismic data acquisition work, as part of Phase 1. Consequently, the Operator (Energean Hellas Ltd), together with its partners, ExxonMobil Exploration and Production Greece (Crete) BV and HelleniQ Upstream West Kerkyra SA, intends to commence the Exploration Phase activities, namely the drilling of one (1) offshore exploration well, named

'Asopos-1', in Block 2 of the Ionian Sea, off the coast of western Greece, in 2027, which forms the subject of this EIA.

#### 2.1.2 Summary description

---

The Asopos - 1 will be carried out as a single, predominantly vertical well at great sea depths, using a Mobile Offshore Drilling Unit (MODU), hereinafter referred to as the 'floating drilling unit'. The floating drilling unit will maintain its position using a dynamic positioning (DP) system, without the use of anchors, thereby avoiding seabed disturbance associated with anchoring. The well will be drilled sequentially in sections of progressively smaller diameter, using water-based drilling mud, the installation of steel casing and the

carrying out of cementing operations, in order to ensure the integrity of the well and the effective isolation of the individual underground geological formations.

The shallow sections of the well will be drilled without the use of a cuttings riser or drilling fluids (riserless), using seawater and water-based drilling fluids (slurries), whilst drilling cuttings and associated drilling fluids will be discharged near the seabed, in accordance with the existing regulatory framework. Following the installation of the surface casing and the subsea blowout preventer (BOP), the deeper sections will be drilled using a riser. The returned drilling fluids will be channelled to the drilling rig, where, using appropriate solids separation equipment, cuttings will be separated and the fluids will be treated for reuse. Water-based fluids will be used exclusively throughout the drilling programme. The geological formations will be assessed using well logging and, where required, by carrying out a short vertical seismic profile (VSP). No production testing or gas flaring is planned.

Offshore operations will be supported by two platform supply vessels (PSVs – PSVs), which will operate between the drilling rig and the temporary onshore support base within the existing Port of Igoumenitsa. Personnel will be transported by helicopter from Corfu International Airport (CFU). Project activities at both locations (the onshore base and Corfu International Airport) will be confined to the existing and authorised port and airport infrastructure. There is no requirement to construct a new port or quay, carry out dredging or land reclamation works, make alterations to the coastline, undertake works on the runway, or permanently extend the airport's facilities.

The duration of drilling operations is estimated at approximately 57 days in the case of a dry well and at approximately 67 days in the event of hydrocarbon discovery. For the purposes of the environmental assessment, a conservative maximum duration of 90 days (i.e. the worst-case scenario) has been adopted to allow for any potential delays due to adverse weather conditions or operational requirements. Throughout the period during which the floating drilling unit remains at the work site, a temporary safety zone with a radius of 500 m will be in force, covering a total area of approximately 0.79 km<sup>2</sup>. Once the work has been completed, the well will be permanently abandoned by means of safe plugging and abandonment. According to the existing abandonment plan, the wellhead will remain in place, occupying a permanent footprint on the seabed of less than 1 m<sup>2</sup>. The Project does not involve the installation of pipelines, production facilities or other permanent subsea infrastructure.

### 2.1.3 Environmental classification

In accordance with Ministerial Decision DIPA/37674/10 August 2016, as amended by Ministerial Decisions 2307/2018 and YPEN/DIPA/17815/1069/2022 (Government Gazette 841/B'/24 February 2022) and currently in force, the main activity of the Asopos-1 drilling project falls under Group 5 'Mining and related activities', serial number 7

'Extraction of hydrocarbons and exploratory drilling for hydrocarbons' and is classified under Sub-category A1, given that all works relating to this activity are classified as such.

Furthermore, the onshore support facilities at the Port of Igoumenitsa fall within Group 3 'Port works', serial number 2a 'Ports and port facilities serving industrial activities (e.g. serving industrial facilities, handling of

fuels, petrochemicals or chemical products, toxic and harmful substances, quarry products, etc.)' and are classified under Sub-category A2.

Given that the classification of all project components follows the classification of the project component classified in the highest category, the project as a whole is classified in Subcategory A1.

This EIA has been prepared in accordance with current Greek legislation and the relevant European directives. It is also based on the updated Environmental and Social Baseline Study (ESBS), which incorporates the results of the geophysical and environmental field surveys carried out in the specific area as part of the project.

#### 2.1.4 Geographical location and administrative affiliation

The proposed 'Asopos-1' exploration well is located within Block 2 of the Greek Exclusive Economic Zone (EEZ) in the north-western Ionian Sea, at a depth of approximately 840 m. There are no islands, coastal features or fixed subsea installations in the immediate vicinity of the well site.

The drilling site is situated approximately 3.16 km (1.71 nm) east of the Greece–Italy EEZ boundary. The nearest Italian mainland coast is at Punta Ristola (Apulia), approximately 54.9 km (29.7 nm) from the drilling site, whilst the nearest Greek landmass is Othonoi Island (part of the Diapontia Islands), approximately 44.3 km (23.9 nm) from the drilling site.

At an administrative level, Block 2 covers the area situated within the Regional Unit (RU) of Corfu in the Region of the Ionian Islands (PIN), whilst its western boundary follows the demarcation line between the areas of the continental shelf of Italy and Greece, in accordance with the relevant agreement of 24 May 1977, which was confirmed/extended by the 2020 Greece–Italy Agreement on the delimitation of their respective maritime zones<sup>4</sup>, which defines this dividing line in accordance with the median line principle.

Administratively, the Port of Igoumenitsa is situated within the Municipality of Igoumenitsa, in the Regional Unit of Thesprotia, in the Region of Epirus. The port facilities are operated by the Igoumenitsa Port Authority SA (OLIG SA), which holds the exclusive right to use and operate the Port of Igoumenitsa under a concession agreement with the Hellenic Republic.

The maritime supply route from Igoumenitsa to the drilling site is approximately 129.4 km, following established shipping routes via the Northern Channel of Corfu, whilst the direct helicopter route from Corfu International Airport is approximately 81.9 km. These existing supply routes minimise the need for additional infrastructure and reduce the duration and distance of support journeys compared with more remote alternatives.

<sup>4</sup> Agreement between the Hellenic Republic and the Italian Republic concerning the delimitation of their respective maritime zones, Athens, 9 June 2020. United Nations Treaty Series (UNTS), No. 57024, ratified by the Hellenic Republic by Law No. 4716/2020 (Government Gazette 163/28 August 2020) and by the Italian Republic by Law No. 93/01/07/2021 (GU 149/24 June 2021)

## 2.2 Project objective and rationale

The aim of the Project is to assess the hydrocarbon potential of the 'Asopos' structure within Block 2, through the drilling of an offshore exploration well and the necessary accompanying support activities. The Project aims to investigate an extensive, clearly defined subsurface structure identified through extensive geological and geophysical studies, including the acquisition and interpretation of modern 3D seismic data. The project focuses on the 'Asopos' structure, which covers an area of approximately 1,000 km<sup>2</sup> and represents the first offshore exploration well in Western Greece since 1981, when the 'West Katakolo' field was discovered. More broadly, this will be the first exploratory drilling operation in Greece since the Epanomi-1 onshore well was drilled in 1986. However, this drilling operation is not a new development for the wider Adriatic region, where dozens of wells have been drilled to date, several of which have led to the discovery of hydrocarbon deposits.

The primary objective of the Project is the safe and reliable assessment of the hydrocarbon potential of the Asopos area through the drilling of one (1) offshore exploration well, in full compliance with applicable environmental and regulatory requirements, as well as safety requirements. The available petroleum system studies indicate potentially favourable conditions, including mature source rocks, hydrocarbon migration pathways and the presence of suitable geological traps and sealing mechanisms. Nevertheless, the geological target has not yet been investigated by drilling and continues to be characterised by the uncertainties associated with hydrocarbon exploration at great marine depths, particularly in an area of the Ionian Sea where no exploratory drilling has previously taken place. The proposed drilling is the only appropriate next step to reduce these uncertainties, verify the existing geological model and collect well logs, samples, pressure measurements and other data that cannot be obtained solely through surface geophysical methods. The feasibility of the Project has been assessed on the basis of the available geological, geophysical, technical, operational, environmental and logistical data. Although certain key parameters regarding the prospects of the 'Asopos' require confirmation through the proposed exploratory well, the existing data provide the necessary technical and operational basis for carrying out the 'Asopos-1' offshore exploratory well in Block 2.

At EU level, the Project is consistent with the broader objectives of ensuring security of energy supply and strengthening the resilience of the energy system by improving knowledge of the potential of domestic resources within European waters. Although the project itself is a research initiative and does not prejudge the development of deposits, the data generated may, should the existence of resources be confirmed, provide crucial information for future discussions on supply diversification, the interconnectivity of regional infrastructure and long-term energy security within the European Union, with the ultimate aim of protecting European energy consumers.

The project is also of national significance, as it will be the first offshore exploratory well to be drilled in Western Greece for around four decades. The geological, geophysical and environmental data obtained during the project will be made available to the Hellenic Hydrocarbon and Energy Resources Management Company (EDEYEP), thereby contributing to the national offshore geological database and supporting future basin assessment, maritime planning and scientific research in the Ionian Sea and Western Greece.

Block 2 is characterised by a relatively high level of technical maturity, supported by modern seismic data sets and a clearly defined drilling target, whilst acknowledging that the key reservoir parameters and the

presence of hydrocarbons remain uncertain prior to drilling. The proposed exploration well under consideration is a milestone, as it marks the resumption of investment in offshore exploration wells in Greece after four decades, carried out in accordance with modern technical and environmental standards and safety protocols.

The project is being carried out by a consortium of national and international companies with proven experience in offshore operations. This collaboration offers world-class expertise in deep-water projects and reaffirms international confidence in Greece's energy sector. The Project will also result in the transfer of relevant high-resolution geological and environmental data to EDEYEP, in accordance with applicable legal and contractual provisions, creating a long-term national scientific resource for the assessment and research of the basin.

## 2.3 Compatibility of the project

### 2.3.1 Legislative framework

The Project is governed by a comprehensive framework of national, EU and international requirements concerning hydrocarbon exploration, environmental assessment, offshore safety, the prevention of marine pollution, the protection of biodiversity, waste management, cooperation and stakeholder engagement.

The legal framework for concessions and exploration activities comprises Law 2289/1995 on the exploration and exploitation of hydrocarbons, Law 4001/2011 on energy markets and hydrocarbon activities, and the Block 2 Lease Agreement ratified by Law 4525/2018.

Environmental authorisation is carried out in accordance with Law 4014/2011 and the requirements of Directive 2011/92/EU on Environmental Impact Assessment, as amended by Directive 2014/52/EU. The wider research programme was previously examined through the Strategic Environmental Assessment for the Ionian Sea, which was prepared pursuant to Directive 2001/42/EC and the corresponding national legislation. This EIA provides the project-specific assessment required for the Asopos 1 drilling operation and incorporates the findings of the updated Environmental and Social Baseline Study (ESBS), the geophysical surveys, the shallow-hazards assessment and the specialised studies.

Offshore drilling safety and the prevention of major accidents are primarily regulated by Directive 2013/30/EU and Law 4409/2016. Prior to the commencement of drilling operations, the detailed drilling programme will be submitted as part of the Notification of Well Operations procedure, whilst the mobile drilling unit (MODU) will operate in accordance with the framework set out in the Report of Major Hazards (RoMH) – RoMH), which is being prepared and submitted to EDEYEP for review and approval in accordance with Directive 2013/30/EC. It should be noted that the key findings of this report, together with the Quantitative Risk Assessment (Quantitative Risk Assessment – QRA), are included in this EIA (Chapter 9), in accordance with the requirements of Greek legislation and, in particular, Joint Ministerial Decision 170225/2014, as currently in force.

The design and execution of the works will follow recognised Good International Industry Practices (Good International Industry Practices – GIIP), Good Oilfield Practices and the relevant Best Available Techniques (BAT), including multiple well control barriers, blowout prevention equipment, emergency shutdown systems,

vessel safety measures, spill prevention measures and emergency response procedures. The protection of the marine environment encompasses the Marine Strategy Framework Directive and Law 3983/2011, the Water Framework Directive, the Environmental Liability Directive, the Waste Framework Directive, the Barcelona Convention and the Offshore Protocol, MARPOL, the Convention on Preparedness, Response and Cooperation in the Event of Oil Pollution, the Ballast Water Management Convention, SOLAS and the United Nations Convention on the Law of the Sea. Requirements relating to biodiversity include the Habitats and Birds Directives, the Convention on Biological Diversity, the Bonn and Bern Conventions, ACCOBAMS and other relevant species protection agreements. Public information and participation are addressed through the current legislation on EIA and the Aarhus and Espoo Conventions.

## 2.3.2 Spatial planning & land use

### 2.3.2.1 Spatial planning

At national level, the Project is compatible with the strategic framework governing Greece's maritime space: the National Spatial Strategy for the Maritime Space (NSSMS), approved by Council of Ministers Act (PYS) 6/17 April 2025 (Government Gazette D 227/2025), recognises offshore hydrocarbon exploration as a maritime activity that can contribute to the assessment of domestic resources and to energy security, provided that it is carried out in a manner that protects marine ecosystems, is compatible with other maritime uses and minimises environmental impacts. The 'Asopos-1' exploratory well is located within the Northern Ionian Marine Spatial Unit (Unit 4). Given that a specific Marine Spatial Planning Framework has not yet been adopted for this unit, compatibility has been assessed against the National Spatial Strategy for the Maritime Space, the applicable sectoral frameworks and the environmental conditions set out for the Ionian research programme.

The supporting onshore logistics facilities at the Port of Igoumenitsa are fully compliant with the provisions of the Regional Spatial Framework for the Region of Epirus (Government Gazette 286/AAP/28 November 2018), according to which the Port of Igoumenitsa is designated as a major international maritime gateway for Western Greece and as a strategic centre for transport, freight and logistics. The Framework promotes the diversification of port activities and specifically recognises the port's potential role in supporting hydrocarbon exploration and possible future production activities in Epirus and the Northern Ionian Sea. Consequently, the use of the port to support the 'Asopos-1' exploratory well is consistent with the approved regional spatial planning strategy and with the port's established role as a cross-border transport hub for the Adriatic-Ionian region. The Project does not require the creation of a new development area, infrastructure corridor or permanent offshore installation. The marine works will be temporary and limited to a single borehole, whilst the onshore facilities will utilise existing port and airport infrastructure. No coastal land reclamation, dredging, extension of statutory boundaries or alteration to the long-term spatial function of the Port of Igoumenitsa or Corfu International Airport is proposed. Consequently, the Project is not expected to conflict with the objectives of the General Framework for Spatial Planning (GFSP), the relevant specific spatial planning frameworks or the planning guidelines applicable to the wider coastal and marine area.

Under the Marine Strategy Framework Directive (MSFD), the proposed Asopos-1 exploratory well is located within the 'Ionian Sea and Central Mediterranean Sea' sub-region. The Greek MSFD monitoring programme

uses the nearest open-sea monitoring station, 'Othonoi (Ionian)', to support the assessment of Good Environmental Status (Good Environmental Status – GES) in the wider project area. The monitoring programme assesses relevant qualitative descriptive criteria, including biodiversity (D1), eutrophication (D5), bottom integrity (D6), hydrographic conditions (D7), pollutants (D8) and marine litter (D10).

### 2.3.2.2 Land use

The Asopos-1 exploration well is entirely offshore and does not require the occupation of any new land area or the construction of any new onshore infrastructure. During drilling, a temporary safety zone of 500 m will be maintained around the drilling unit for reasons of maritime and operational safety. This restriction will apply only whilst the drillship is on site and will be lifted upon completion of the drilling campaign. Following plugging and abandonment, the permanent physical presence will be limited to the remaining wellhead, with a footprint on the seabed of less than 1 m<sup>2</sup>; no pipelines, production facilities or other permanent subsea infrastructure will be installed.

The facilities of the onshore support base are located within the legally defined Port Zone of Igoumenitsa, which is designated as 'Port Zone B4.5' in accordance with the approved General Urban Plan of Igoumenitsa (Decision 73578/4964/17 December 2010, Government Gazette 575/AAP/31 December 2010). More specifically, the proposed facilities fall within the operational areas of Port Th6 and PA and within Building Blocks OT8 and OT7, respectively. The approved Master Plan for the Port (Ministerial Decision 8216/126/14 'Revision of the Master Plan for the Port of Igoumenitsa') permits port services, commercial activities and storage uses in these areas. Consequently, the proposed activities of temporary storage, cargo staging, logistics and vessel support are compatible with the established land-use classifications and do not require reclassification or extension beyond the controlled land port zone.

Aviation support will be accommodated within the existing Corfu International Airport (CFU). The facilities will be temporary and will not alter the existing land uses, capacity, regulatory status or primary function of the airport.

Overall, the Project concentrates its ground-based support activities within established and authorised transport infrastructure, thereby avoiding new land take and limiting potential interaction with residential, tourist, agricultural or other incompatible land uses.

### 2.3.3 Environmental sensitivity aspects of the project

The Project does not fall within any area of the Natura 2000 Network of Protected Areas, nor within any other legally designated protected area.

The nearest Natura 2000 sites to the Asopos-1 exploratory well are site GR2230010

'Marine Area of the Diapontia Islands' and GR2230008 'Diapontia Islands: Othonoi, Ereikousa, Mathraki and Vrachonissides', both approximately 41 km from the well. The nearest Natura 2000 sites to the Igoumenitsa onshore base are GR2120001 'Kalamata Estuary (Delta)' and GR2120005 'Kalamata Estuary Wetland and Prasoudi Island', approximately 3.5 km from the proposed facilities.

As part of the preparation and planning for the proposed exploratory drilling and the preparation of the Baseline Environmental and Social Study, specific environmental, geophysical and geological surveys were carried out for the Project, including a shallow-hazard survey to identify sensitive seabed habitats, geohazards, cultural heritage features and man-made infrastructure. The selected location for the exploratory well lies outside any identified sensitive seabed features and is separated from known archaeological sites, shipwreck remains and subsea cables. The deep seabed in the immediate operational area consists mainly of fine-grained deep-sea sediment, whilst no environmental or geotechnical constraints have been identified that would preclude drilling, provided that the mitigation and monitoring measures set out in the Environmental and Social Impact Assessment (ESIA) are implemented.

A detailed description of national and international protected areas, as well as the distances of the 'Asopos-1' drilling site from these, is presented in the Environmental and Social Baseline Study (ESBS), which incorporates the results of the geophysical and environmental field surveys carried out in the specific area as part of the project, and accompanies this ESIA.

The onshore support facilities are located within the existing developed Port of Igoumenitsa and do not extend into forested areas, protected natural areas or archaeological sites. The area of the onshore support base is also situated within the Potentially Significant Flood Risk Zone, known as 'Kato Rous – Delta of the Kalamas River and Coastal Zone of Igoumenitsa', as does the majority of the Port of Igoumenitsa. Consequently, flood risks as well as potential climate-related risks have been taken into account in the siting of the temporary support facilities within the area granted by OLIG to the implementing body and are being addressed through specific – site-specific – drainage, emergency preparedness and climate change adaptation measures, whilst corresponding measures are provided for in the port's current AEPO and are being implemented.

## 2.4 Technical description of the project

The 'Asopos-1' exploratory well is scheduled to be drilled in 2027, with a start window in the first quarter of 2027, subject to regulatory approvals, the contractor's availability and the project's readiness. Subject to operational, contractual and regulatory constraints, drilling is expected to commence outside the peak tourist season, where feasible.

The work will be carried out using the Stena DrillMAX mobile drilling unit (MODU), supported by maritime and aerial support services. A mobile drilling unit is a self-contained vessel specially designed for offshore drilling in deep waters, equipped with a drilling system and a 'moonpool' opening in the centre of the hull, which allows the drilling equipment to be deployed directly through the hull to the seabed.

Once the unit arrives in the operational area, drilling and related activities will be carried out continuously, 24 hours a day, 7 days a week, to ensure safe and efficient operation. The rig will remain on site only for the time required to complete the drilling, formation evaluation and, where applicable, the plugging and abandonment of the well.

The offshore exploratory drilling operation will be supported by a combination of maritime and aerial support, in conjunction with the use of an existing onshore supply base. The offshore exploratory drilling operations

will be supported by supply vessels (PSVs) which will operate between the onshore supply base at Igoumenitsa and the MODU at the

‘Asopos-1’. These vessels provide essential support and safety throughout the duration of the exploratory drilling. The activities of the support vessels will be limited to the duration of the offshore exploratory drilling. The supply vessels and helicopters supporting the Project will be temporarily chartered from third-party service providers for the duration of the exploratory drilling operation.

A remotely operated vehicle (ROV) is an unmanned, manoeuvrable underwater vehicle. The project’s ROV will be deployed and operated from the floating drilling rig via a connection and power supply cable system to provide power, control and data transmission. Its operations will be carried out at intervals throughout the drilling programme, with the aim of supporting offshore activities. The remotely operated underwater vehicle will be used to survey the seabed prior to drilling, to inspect and monitor subsea equipment such as the hoist and the blowout preventer (BOP), to provide support during well capping and abandonment, as well as for a post-operation survey to verify that the seabed has been cleared and that no debris remains prior to the removal of the platform.

The project-specific support facilities will be located within existing port and airport areas. No new permanent onshore or offshore infrastructure is required to support the proposed activities.

Offshore activities include the mobilisation of the drilling rig, the construction and evaluation of the well, the operation of support vessels and remotely operated vehicles (ROVs), standard maritime and aerial logistics operations, as well as the subsequent plugging and abandonment (P&A) of the well. Drilling operations will utilise water-based drilling fluids (WBM), with no planned use of non-aqueous drilling fluids. The MODU (Mobile Offshore Drilling Unit) will maintain its position using a dynamic positioning system, with no planned use of anchors, thereby avoiding seabed disturbance associated with anchoring.

The drilling programme has been designed to progress sequentially from the shallow formations to the planned final depth of the well, with the integrity of the well being maintained at all stages through drilling, the installation of casing, cementing and pressure control systems. The programme will be submitted to the Hellenic Hydrocarbons and Energy Resources Management Company (EDEYEP) for approval, as part of the Notification of Well Operations (NoWO), prior to the commencement of drilling.

Drilling commences with operations without a subsea riser in the shallow sections of the well, during which water-based drilling fluids are used and drill cuttings are discharged in the immediate vicinity of the well site. This stage involves the installation of the protective casing and the drilling of the upper sections of the well required to form its structure.

Following the installation of the Blowout Preventer (BOP) and the tubing for lifting cuttings and drilling fluids, drilling continues in a controlled, closed-loop environment.

The deeper sections of the borehole (17½", 12¼" and 8½") are drilled using progressively smaller sections of casing, which are installed and cemented in place at each stage to ensure zone isolation and structural stability. Drilling fluids circulate between the drill bit and the borehole. Cuttings are returned to the vessel where they are processed, whilst the fluids are treated and reused where appropriate. Drilling fluids circulate between the Mobile Offshore Drilling Unit (MODU) and the well. Drilling cuttings are returned to the MODU and processed on board, whilst the fluids are suitably treated and reused where appropriate.

Well pressure is continuously monitored and controlled through the appropriate management of the water-based drilling mud. Where required by the geological conditions encountered whilst drilling deeper formations, the Managed Pressure Drilling (MPD) technique may be used. Should abnormal pressure conditions ('kick') arise, the hydrostatic pressure of the fluid and the backpressure, where applied, will provide a margin for managing uncertainty regarding formation pressures. In the unlikely scenario of fluid inflow into the well, the aforementioned technique may be used to manage the pressure conditions within the wellbore. In the event of a well runaway incident, well control procedures will be implemented using the blowout preventer (BOP) and the relevant well control systems, in accordance with the Well Control Procedures Harmonisation Document.

In the unlikely event of failure of the primary barrier (hydrostatic pressure) and the secondary barrier (BOP), the pre-installed subsea Emergency Shut-in Device (E-SID), positioned between the wellhead and the blowout prevention system, provides an additional independent means of isolating the well. Activation of this device, in accordance with established control procedures, effectively eliminates the likelihood of the incident escalating.

Formation evaluation is carried out during and after drilling, using a combination of logging whilst drilling (Logging While Drilling – LWD), wireline logging, monitoring and analysis of drilling fluids and cuttings, and biostratigraphic analyses. These methods provide continuous geological and petrophysical data and support real-time operational decision-making. As part of wireline logging, it may be necessary to carry out a Vertical Seismic Profile (VSP). A VSP is a geophysical survey carried out within the borehole with the aim of obtaining high-resolution seismic data from the geological formation surrounding the borehole. If carried out, the VSP activity is expected to be one of the exclusively temporary sources of underwater acoustic energy associated with the drilling programme, of short duration (lasting a matter of hours and significantly shorter in duration and intensity than the 3D seismic survey carried out in the area several years ago). Overall, the drilling phase is characterised as a strictly controlled and sequentially executed activity, which incorporates multiple technical safeguards to prevent loss of well control and involves the application of established practices for managing environmental risks, particularly those relating to drilling discharges, underwater noise and emissions from logistical support activities.

#### Decommissioning and abandonment phase

Following the completion of drilling and evaluation, the well will be brought to a safe state through a permanent plugging and abandonment (P&A) programme.

Cement plugs will be installed and verified in order to isolate the relevant formations and ensure the long-term integrity of the well, in accordance with the approved drilling programme, the requirements of the Greek regulatory framework and internationally recognised best practices in the industry.

Under the current plan, the subsea wellhead will remain in place following final abandonment. All other temporary subsea equipment, including positioning transponders, will be recovered.

Once the work has been completed, an inspection will be carried out using a Remotely Operated Vehicle (Remotely Operated Vehicle – ROV) to verify the condition of the seabed, confirm that the equipment and any debris have been removed, and document the final condition of the site. Subsequently, the mobile drilling unit (MODU) and support vessels will be decommissioned and will leave the area, whilst the temporary 500-

metre safety zone will be lifted. Materials and waste returning from the offshore area will be transported via the supply base and delivered to appropriately licensed facilities.

The temporary offices, temporary storage areas, equipment and the airport hangar will be removed, whilst the areas used will be restored to the condition required by the port and airport operators.

No permanent land-based facilities, production facilities, pipelines or other infrastructure will remain as part of the Project.

## 2.5 Alternatives

### 2.5.1 Assessment of alternatives

---

As part of the project's design, a detailed assessment of alternatives was carried out across a fairly broad range of design parameters and operational arrangements for the activities, with the aim of identifying the most suitable options for achieving the project's objectives, whilst minimising environmental impacts and operational risks.

The 'No-Action' alternative was also assessed, under which the drilling and all related mobilisation, drilling and support activities would not be carried out. This option would prevent the temporary environmental and social impacts of the Project; however, it would not achieve the research objectives, would not fulfil the relevant minimum work commitment, nor would it provide the necessary geological and environmental information expected from the exploratory drilling to determine whether or not hydrocarbons are present. The assessment examined reasonable alternatives for key aspects of the project, including the location of the well, the direction of drilling, the type of drill bit, the drilling strategy, the drilling fluids, cuttings management, the method of cementing the borehole, lighting of the work area, the abandonment strategy and the supporting logistics infrastructure.

Each alternative was assessed on the basis of four (4) criteria:

- Regulatory compliance – alignment with applicable legislation, licensing requirements and recognised industry standards;
- Technical feasibility – suitability of the option for safely achieving the project's objectives under the expected site conditions;
- Economic feasibility – the relative cost and operational efficiency of the alternative solution;
- Environmental compatibility – the ability to avoid or minimise environmental disturbances, emissions, waste generation and resource use.

The assessment was carried out on the basis of technical information, data, environmental parameters, operational requirements and industry experience. Where alternatives were deemed technically or regulatory unfeasible, they were excluded and not considered further.

The preferred option for each component of the project was selected on the basis that it represented the most appropriate balance between technical performance, environmental protection, operational efficiency and regulatory compliance.

Error! Reference source not found. summarises the assessment for all thematic areas (drilling location, direction, drill bit type, drilling programme, fluids, cementing, lighting, abandonment, supply chain, etc.).

**Table 2-1: Evaluation of project alternatives and options**

| AREA                          | OPTION                                                                                         | REGULATORY                     | TECHNICAL                    | FINANCIAL                    | ENVIRONMENT                  | OVERALL                                                                                                                                                                      |

|                 | Port of Patras                | Compliant                      | Favourable                   | Acceptable with restrictions | Acceptable with restrictions | <b>Not preferred</b> – longer transport distances                                     |
|                 | Port of Thisbe                | Complies subject to conditions | Acceptable with restrictions | Unfavourable                 | Acceptable with restrictions | <b>Not preferred</b> – the candidate's availability is not guaranteed                 |
| Helicopter base | Corfu Airport                 | Complies                       | Favourable                   | Favourable                   | Favourable                   | <b>Preferred</b> – proven experience in the offshore aviation sector                  |
|                 | Alternative regional airports | Complies subject to conditions | Unfavourable                 | Not assessed in detail       | Not assessed in detail       | <b>Not preferred</b> – limited experience of helicopter operations in offshore areas  |
| Support vessels | Two (2) service vessels (PSV) | Complies                       | Favourable                   | Favourable                   | Favourable                   | <b>Preferred</b> – minimising vessel traffic and emissions                            |
|                 | Three (3) PSV vessels         | Compliant                      | Favourable                   | Acceptable with restrictions | Acceptable with restrictions | <b>Not preferred</b> – greater logistical footprint than required for this expedition |

## 2.6 Current environmental conditions

The existing environmental and social conditions in the wider project area were determined through the Environmental and Social Baseline Study (ESBS) Phase 2, supported by specialised geophysical, environmental, oceanographic, acoustic and archaeological surveys. The assessment combined current published information and official databases with primary data collected during two (2) offshore survey campaigns in March and April 2026. The surveys included high-resolution seabed mapping, geohazard assessment, water column and sediment sampling, benthic and plankton analyses, environmental DNA

sampling, current measurements, passive acoustic monitoring and visual observations of marine mammals, sea turtles and birds.

The preparation of the Environmental Impact Assessment (ESBS) is a mandatory requirement under Greek legislation, specifically Article 12.14 of the Lease Agreement, which was subsequently ratified by Law 4525/2018, requiring the documentation of the conditions of the existing environmental status prior to the commencement of offshore activities. The baseline establishes the reference conditions against which potential future environmental changes attributable to the Project can be assessed. Furthermore, it meets the baseline requirements established under the Strategic Environmental Assessment (SEA) Approval for the Ionian Sea (Approval No. 30373/03.07.2017).

Detailed offshore surveys covered the immediate vicinity of the drilling site as well as a wider survey area of approximately 100.2 km<sup>2</sup>, whilst information was utilised at a regional level where migratory species, marine activities, cumulative pressures or potential cross-border pathways required a broader spatial context. For onshore logistics facilities, the assessment took into account the existing Port of Igoumenitsa and its surrounding coastal, urban and environmental context.

## 2.6.1 Natural environment

The Asopos 1 exploration well is located in the northern Ionian Sea at a water depth of approximately 840 m. The regional climate is Mediterranean, with mild, wet winters and hot, dry summers. Winds at the well site predominantly come from the north and north-north-west, with stronger conditions occurring more frequently during the winter. The water column exhibits seasonally-driven stratification, with the main water masses in the Ionian Sea comprising the Modified Atlantic Waters in the surface layer, the Levantine Intermediate Waters at depths of approximately 150 and 500 m depth, and the Eastern Mediterranean Deep Waters below approximately 1,600 m (Schlitzer et al., 1991; Malanotte-Rizzoli et al., 1997). Ocean circulation in the northern Ionian Sea is also influenced by quasi-decadal reversals of the Northern Ionian Vortex, which affect the thermohaline characteristics of the basin (Borzelli et al., 2009; Gacic et al., 2010; Bensi et al., 2016). Below approximately 300–500 m, the water column is generally characterised by relatively uniform temperatures ranging from 13.5 °C to 15.5 °C and salinity between 37.5 and 39.5 PSU (Coll et al., 2010). The currents near the seabed measured during the survey were generally weak, usually below 0.10 m/s.

The offshore marine environment is by nature oligotrophic, with low nutrient availability and low primary productivity. Project-specific measurements indicated low turbidity, low chlorophyll concentrations and generally low nutrient levels. The temperature, salinity, pH and dissolved oxygen were consistent across all survey stations and representative of open-sea conditions in the northern Ionian Sea. The survey results did not indicate any pre-existing pollution from hydrocarbons. Detailed bathymetric mapping indicates that the seabed within the survey area slopes gradually from west to east. The drilling site is situated on a gentle seabed slope of approximately 1.3 degrees and is located within a shallow, sediment-filled trough associated with an older mass-transport deposit, thus avoiding the steeper hard-substrate ridges. The surface sediments consist mainly of homogeneous clayey silt and silty clay. Concentrations of organic carbon, nutrients and petroleum hydrocarbons are low, whilst no microplastics were detected in the analysed sediment samples. Arsenic, nickel and total chromium exceeded selected screening values at certain

stations; these concentrations form part of the site-specific baseline and were not accompanied by evidence of pollution from petroleum hydrocarbons.

Geophysical surveys and shallow-hazard geological analyses did not identify any active gas seeps, gas chimneys, active pockmarks, acoustic plumes, mud volcanoes, gas hydrates or recent fault-related seabed displacement within the immediate vicinity of the Project. No fault scarps were identified within 500 m of the drilling site. Localised acoustic wipe-out features were identified within the 500 m assessment area, starting at approximately 8 m below the seabed. The nearest anomaly detected is located approximately 243 m from the well location at an azimuth of 214°. These features may be related to fluid-related processes, including dehydration within the deformed material of the mass-transport deposit, although their exact origin cannot be confirmed from the available data. Given the gentle slopes of the seabed and the absence of evidence of recent sediment resuspension, the vulnerability of the selected site to active slope failures or submarine landslides is assessed as low. The onshore support facilities will be located entirely within the existing developed Port of Igoumenitsa. The port occupies a coastal site at a low elevation, surrounded mainly by mountainous terrain, with the exception of the eastern side, where the Ladochori plain is located. The port is adjacent to the heavily modified coastal water body 'Gulf of Igoumenitsa' (EL0512C0003H), which is characterised by good chemical status but an ecological potential below 'good' according to the 2nd Revision of the River Basin Management Plan for the Epirus River Basin District (Government Gazette A 71/17 May 2024). The onshore logistics base facilities fall within the 'Filiates-Igoumenitsa' Groundwater Body 'Filiates-Igoumenitsa' (EL050A070), which has been classified as being in good chemical and quantitative status. The nearest designated bathing waters are classified as 'Excellent Quality' according to data from the Bathing Water Register (Ministry of Environment and Energy).

The area of the onshore facilities is located within the Potentially High Flood Risk Zone (PHFRZ) with code EL05APSFR008 and named 'Lower Course and Delta of the Kalamas River and the Igoumenitsa Coastal Zone'. It is therefore likely to be affected by heavy rainfall, river or coastal flooding, as well as a potential long-term rise in sea level.

The wider Ionian region is tectonically active; however, high-resolution survey data have not identified any evidence of recent fault movement on the seabed within 500 m of the borehole. The likelihood of a tsunami occurring directly at the drilling site, or of active slope failure or seabed subsidence, is considered low.

Climate change is expected to become an increasingly significant factor in environmental change. Relevant trends include higher air and sea-water temperatures, ongoing ocean acidification, changes in species distribution, potential increases in extreme rainfall and storm intensity, and a gradual rise in sea level. The

'Asopos - 1' well is not directly exposed to coastal flooding or erosion, although changing meteorological and oceanographic conditions may affect its operational design. The low-lying port of Igoumenitsa is more directly vulnerable to coastal flooding, sea-level rise and heavy rainfall.

## 2.6.2 Biotic environment

The available literature indicates that the deep-sea benthic environment of the Eastern Ionian Sea is characterised mainly by soft-substrate habitats consisting of fine-grained silty and silty-clay sediments. Consistent with the conditions described for the eastern Ionian Sea, AUV observations and macrozoobenthic

analyses indicate that the seabed within the study area is largely homogeneous and dominated by the Mediterranean Upper Deep-Sea Mud biocoenosis (EUNIS code: ME65). This habitat is characterised by fine-grained sediments that support benthic communities adapted to deep-water conditions. Observations included evidence of burrowing and tube-dwelling organisms, occasional species of deep-sea fish of the family Macrouridae, and localised areas associated with the burrowing sea anemone *Andresia partenopea*.

A limited area of rocky substrate corresponding to the Mediterranean Upper Deep-sea Rock biocoenosis (EUNIS code: ME15) was identified at station D4a. This hard-substrate habitat supported deep-water coral assemblages associated with *Antipathella subpinnata* and/or *Callogorgia verticillata*, representing a local increase in habitat diversity within the predominantly soft-substrate deep-sea environment.

Based on the regional literature, the deep-sea benthic environment of the eastern Ionian Sea supports biological assemblages specifically adapted to oligotrophic conditions, deep-water isotherms and high salinity. The benthic communities were characterised by low abundance, reduced species richness and limited diversity, confirming the conditions typically observed in oligotrophic Mediterranean deep-sea environments. The ecosystem was dominated by the Mediterranean Upper Deep-Sea Mud biocoenosis (EUNIS code: ME65). A total of 116 individuals belonging to 19 taxonomic groups were recorded, with annelids (Annelida) overwhelmingly dominating both in abundance (94.8 per cent) and species richness (73.7 per cent). The community structure was largely dominated by the siphonophore *Golfingia* sp., a taxon usually associated with fine-grained deep-sea sediments.

The regional literature characterises the Ionian Sea as a particularly oligotrophic basin, where nutrient depletion in surface waters limits primary production and supports planktonic communities typical of open marine environments. The results of the LOT 02 survey were consistent with this regional baseline. The phytoplankton community showed significant differences between the three sampling depths (surface, mid-water and bottom), indicating that light availability is an important factor controlling its vertical distribution.

The plankton and fish communities are characteristic of an offshore oligotrophic ecosystem. Small flagellates and diatoms predominate in the phytoplankton, whilst the zooplankton is diverse but generally of low biomass, with copepods predominating. The fish plankton community comprises mainly mesopelagic and deep-sea species, with limited coastal influence. Environmental DNA, plankton sampling and visual observations confirmed the presence of pelagic and benthopelagic fish species typical of the northern Ionian Sea, including hake, anchovy, common sole, frogfish, lanternfish and deep-sea cartilaginous fish (cartilaginous fish).

The available literature and existing datasets indicate that the wider Ionian Sea and the periphery of the Hellenic Trench support a diverse assemblage of marine mammals (Notarbartolo di Sciara, 2016), although the occurrence and density of species vary spatially and temporally across the region. Documented species include deep-diving cetaceans such as the sperm whale (sperm whale, *Physeter macrocephalus*), which is classified as Endangered (EN) at the regional Mediterranean level, and Cuvier's beaked whale (*Ziphius cavirostris*), which is classified as Vulnerable (VU) (Notarbartolo di Sciara et al., 2012; Holcer et al., 2007; Thompson et al., 2023; IUCN, 2023). The area is also home to the fin whale (*Balaenoptera physalus*), the only resident baleen whale in the Mediterranean Sea, which is classified as Endangered (EN).

Furthermore, several species of dolphins are found in the area, including the striped dolphin (*Stenella coeruleoalba*), which is classified as Least Concern (LC); Risso's dolphin (*Grampus griseus*), which is

classified as Endangered (EN); the short-beaked common dolphin (*Delphinus delphis*), which is classified as Endangered (EN); the common bottlenose dolphin (*Tursiops truncatus*), classified as Vulnerable (VU); and the rough-toothed dolphin (*Steno bredanensis*), classified as Near Threatened (NT) (Bearzi et al., 2011; Carlucci et al., 2017; IUCN, 2023).

Records of the Mediterranean monk seal (*Monachus monachus*), classified as Endangered (EN), are also available from the wider region (Notarbartolo di Sciara et al., 2009; IUCN, 2023). These species are subject to strict protection under Annex IV of the EU Habitats Directive (Council Directive 92/43/EEC). Furthermore, the Mediterranean monk seal (*Monachus monachus*) is listed in Annex II of the Directive, requiring the designation of Special Areas of Conservation. Cetacean species are also covered by relevant international conservation agreements, including ACCOBAMS, the Bern Convention, CITES and the Convention on Migratory Species (CMS), whilst the Mediterranean monk seal is protected under relevant international conservation frameworks, including the Bern Convention, CITES and the CMS.

Specific marine fauna surveys were carried out during both the LOT 01 and LOT 02 campaigns to record the presence of marine mammals. These surveys also supported the implementation of research mitigation measures in accordance with ACCOBAMS guidance.

The nearest Natura 2000 sites to the Asopos-1 exploration well location are the Diapontia Islands Marine Special Area of Conservation (SAC) (GR2230010) and the Diapontia Islands: Othonoi, Ereikousa, Mathraki and the islets, Special Protection Area (SPA) (GR2230008), both located approximately 41 km north-east of the Project.

The location of the 'Asopos-1' exploration well is within the Ecologically or Biologically Significant Marine Area (EBSA) South Adriatic-Ionian Strait, within which the 'Asopos-1' exploration well is situated. The area encompasses the transition zone between the southern Adriatic Sea and the northern Ionian Sea, including the Strait of Otranto, with water depths ranging from approximately 200 m to 1,500 m. These areas are not legally designated protected areas, but they confirm the wider ecological importance of the region.

The nearest officially designated Important Marine Mammal Area (IMMA) is the 'Ionian Archipelago', approximately 37 km east of the drilling site, whilst the nearest Important Shark and Ray Area (ISRA) is 'Santa Maria di Leuca', approximately 20 km west-south-west.

The proposed areas for the onshore support base are confined to the existing port area of Igoumenitsa Port and do not extend into forests, protected natural areas or designated habitats. The nearest Natura 2000 sites are GR2120001 'Kalamata Estuary (Delta)' and GR2120005

'Kalamata Estuary Wetland and Prasoudi Island', both approximately 3.5 km from the land base. The nearest wildlife refuge is K237 'Varathi', approximately 2 km north of the port, whilst the nearest designated Area of Outstanding Natural Beauty is the Kalamata Estuary, approximately 6.5 km away. As the facilities will remain within the port's existing built-up area, no immediate loss or fragmentation of natural habitat is expected.

Anthropogenic environment

The offshore area around the 'Asopos-1' borehole is mainly used for commercial shipping, fishing and subsea telecommunications infrastructure. The well site is located near, but outside, the main shipping lanes with the highest traffic density, whilst fishing activity takes place in the wider area. Within 100 km of the drilling

site, there are no operational offshore oil and gas installations, aquaculture facilities or renewable energy installations.

Submarine telecommunications cables are present in the wider area, with the nearest operational cable located approximately 2.7 km from the well. Planned offshore wind projects have been identified in neighbouring Italian waters, which are considered part of the wider cumulative development framework, although they are currently at the planning and licensing stage, whilst for the Greek Offshore Wind Farm Programme, which identifies areas suitable in principle for the development of Integrated Offshore Wind Farm Development Areas (POAYAP), the Joint Ministerial Decision for its approval is currently pending

The main onshore areas associated with the Project are Corfu and Igoumenitsa. Corfu's economy is based largely on tourism, whilst Igoumenitsa is an important port and logistics hub linking Western Greece with Italy and the Adriatic region. The project will utilise existing port and airport infrastructure and will not require land acquisition, physical relocation of the population or changes to land use.

The northern Ionian Sea and the Strait of Otranto are of archaeological interest due to their long maritime history. No archaeological features were identified at the drilling site. An archaeological feature (T057), interpreted as an ancient merchant shipwreck, was identified 8.6 km north of the proposed drilling site at a water depth of 880.04 m. However, the drilling site and the operational area are separated from this and from the other identified archaeological features. Existing anthropogenic pressures in the area include shipping, fishing, underwater noise, ship emissions, marine litter and port-related activities. Marine litter at the drilling site was found to be limited, whilst the underwater acoustic environment is characteristic of a marine area with moderate traffic. The Port of Igoumenitsa is already an established transport and logistics hub, with existing road network, wastewater management and waste management infrastructure.

Without the Project, the area is expected to continue to be affected by existing maritime, fishing and port activities, as well as by future regional developments, such as offshore renewable energy projects. Given the temporary nature of the drilling, the Project is not expected to affect the long-term socio-economic or spatial development of the area.

## 2.7 Quantitative Risk Assessment (QRA)

A Quantitative Risk Assessment (Quantitative Risk Assessment – QRA) was carried out for the 'Asopos-1' exploratory well, with the primary aim of assessing the risk to personnel from the identified Major Accident Hazards (MAH), as well as identifying major accident scenarios with environmental consequences. The assessment was based on the existing QRA prepared by the internationally recognised classification and certification body, DNV for the Stena DrillMAX floating drilling unit, and is included in the Major Hazards Report (RoMH) submitted to the Hellenic Authority for the Assessment of Major Accident Hazards (EDEYEP) (Ref. No.: 36452/14 July 2026), adapted to the specific conditions and duration of the 'Asopos-1' exploratory well.

As part of the QRA, the main MAHs associated with the operation of the Floating Drilling Unit were identified and assessed, including blowouts and leaks from the well, fires, explosions and releases of toxic substances, maritime incidents such as ship collisions, loss of position or stability, structural failure and falling objects, as well as workplace accidents and risks associated with the transport of personnel by helicopter. The risk

levels were compared with the applicable risk acceptance criteria of the Hellenic Civil Aviation Authority (HCAA) and assessed in accordance with the ALARP principle.

The risk assessment for personnel conservatively maintained the release frequencies and consequences used in the existing QRA for the Stena DrillMAX. The calculated Individual Risk Per Annum (IRPA) values are  $4.50 \times 10^{-5}$  per year for the operations personnel group,  $4.47 \times 10^{-5}$  per year for the maintenance staff group and  $2.59 \times 10^{-5}$  per year for the accommodation staff group. The maximum IRPA value,  $4.50 \times 10^{-5}$  per year, is lower than the EDEYEP tolerance limit of  $1.0 \times 10^{-3}$  per year. The total Potential Loss of Life (PLL) is estimated at  $5.93 \times 10^{-0}$  deaths per year.

The calculated Fatal Accident Rate (FAR) associated with the facility, excluding helicopter transport, amounts to 2.16 deaths per  $10^8$  hours of exposure, a figure that is also lower than the Project's acceptance criterion of 10 fatalities per  $10^8$  hours of exposure. Transport by helicopter was assessed separately on the basis of actual hours of exposure during the flight and, due to the different normalisation, the corresponding FAR value is not directly comparable with the acceptance criterion applied to the installation. The risk associated with helicopter transport is included, however, in the IRPA and PLL results; in any case, the risk to personnel is primarily associated with helicopter transport and conventional workplace accidents, whilst the contribution of scenarios linked to accidents on the floating drilling unit (MODU) is comparatively limited.

Of particular importance for the 'Asopos-1' exploratory well 'Asopos-1' is the use of the K-BOS (Emergency Shut-In Device (E-SID)) immediate flow-shut-off device, which will be installed as a pre-positioned subsea device between the wellhead and the Blowout Preventer (BOP). The E-SID operates in conjunction with the conventional well control barriers and the BOP system.

The project-specific probabilistic reliability assessment shows that the combined BOP and E-SID arrangement reduces the estimated probability of an uncontrolled blowout from  $1.20 \times 10^{-4}$  to approximately  $2.08 \times 10^{-8}$ . Consequently, a prolonged uncontrolled subsea discharge is not adopted as a representative environmental scenario for a loss of contents from 'Asopos-1'. The E-SID system constitutes an additional risk mitigation measure and supports the conclusion that the risk associated with well control has been reduced in accordance with the ALARP (As Low As Reasonably Practicable) principle.

The risks associated with the drilling of the single exploratory well 'Asopos-1' were compared with the base case scenario of the existing QRA for the Stena DrillMAX Floating Drilling Unit, which covers four HPHT exploration wells per year based on the unit's historical operation. The project-specific assessment presents an even lower risk profile than the rig's already low profile, mainly due to the reduced scope of operations, the shorter duration of exposure and the lower relief flow rate. This comparison constitutes a sensitivity analysis rather than a 'like-for-like' comparison between identical drilling programmes.

**Table 2-2: Sensitivity analysis Comparison**

| PARAMETER                    | BASE CASE – HPHT EXPLORATION CAMPAIGN | PROPOSED EXPLORATION WELL   | COMMENTS                                                                                                                   |
|------------------------------|---------------------------------------|-----------------------------|----------------------------------------------------------------------------------------------------------------------------|
| Number of boreholes examined | 4 HPHT exploration wells per year     | 1 exploration well per year | Reduced frequency of exposure due to the operation of a single well, which helps to reduce individual and collective risk. |

| PARAMETER                            | BASE CASE – HPHT EXPLORATION CAMPAIGN | PROPOSED EXPLORATION WELL               | COMMENTS                                                                                                                                                                                                          |
|--------------------------------------|---------------------------------------|-----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Water depth                          | 500–2,000 m                           | 840 m                                   | Asopos-1 is located at a depth of over 500 m, which is considered deep water and is consistent with the basis of the existing QRA. In shallower waters, the consequences of subsea blowouts would be more severe. |
| Discharge rate                       | Total discharge flow rate 260 kg/s    | Oil – 14 kg/sec;<br>Gas – 79 kg/sec     | This scenario assumes a lower probability of hydrocarbon reservoir leakage compared with the full flow rate used in the base case scenario, thereby reducing the severity of the consequences.                    |
| Total number of workers at risk      | 180                                   | 60, with the figure likely to reach 180 | The total exposure of the group at risk will vary depending on the number of people present.                                                                                                                      |
| Individual risk per annum (IRPA)     | $1.84 \times 10^{-4}$ per year        | $4.50 \times 10^{-5}$ per year          | Reduction in individual risk of approximately 75%.                                                                                                                                                                |
| Probable loss of life (PLL)          | $5.26 \times 10^{-2}$ deaths/year     | $5.93 \times 10^{-3}$ deaths/year       | Approximately 89% lower than the PLL for the reference case, based on the assumptions regarding personnel and exposure used in the QRA for this specific project                                                  |
| Transient Refuge (TR) loss frequency | $6.77 \times 10^{-6}$ per year        | $1.05 \times 10^{-6}$ per year          | Approximately 84% lower than the TR loss rate in the reference case, reflecting the reduced exposure during the exploratory drilling and the assessment assumptions specific to the project.                      |

As shown in Table 2-2, compared with the base case of the four HPHT exploration wells, the Individual Risk per Annum (IRPA) decreases from  $1.84 \times 10^{-4}$  to  $4.50 \times 10^{-5}$  per annum, the Potential Loss of Life (PLL) from  $5.26 \times 10^{-2}$  to  $5.93 \times 10^{-3}$  deaths per year, and the frequency of loss of the Temporary Refuge (TR) from  $6.77 \times 10^{-6}$  to  $1.05 \times 10^{-6}$  per year. These changes correspond to reductions of approximately 75 per cent, 89 per cent and 84 per cent respectively, and primarily reflect the reduced duration and extent of the campaign, as well as the project-specific exposure assumptions.

At the same time, the integrity of the Main Safety Functions was assessed. The calculated loss frequency of the TR is  $1.05 \times 10^{-6}$  per year, whilst the calculated loss frequencies of the Key Safety Functions remain below the applicable acceptance criteria. Therefore, the results confirm that the proposed activity remains within the established safety baseline for the Stena DrillMAX.

Apart from the potential impact on personnel, major accidents may affect environmental and socio-economic receptors through the accidental release of liquid hydrocarbons into the sea. For this reason, a detailed numerical modelling study of an oil spill. Given the installation of the K-BOS immediate flow-shut-off system, which reduces the already low (of the order of  $10^{-4}$ ) probability of an uncontrolled blowout by a factor of two, resulting in an estimated probability of an uncontrolled blowout of  $2.08 \times 10^{-8}$ . As the most representative accidental release scenario for the purposes of the EIA, an instantaneous loss of 350 m<sup>3</sup> of Marine Gas Oil (MGO) from the fuel tank of a (Platform Supply Vessel – PSV) supporting the drilling campaign. This quantity corresponds to approximately 30–40% of the fuel tank of a typical PSV, whilst the corresponding fuel tanks of large cruise ships passing through the Northern Ionian Sea are at least ten times larger,

The modelling assessed the transport and dispersion of the spill in the complete absence of any mitigation measures, i.e. without any detection, containment, recovery or other response actions taking place whatsoever (conservative scenario). According to the model's results, after 30 days only 0.2% of the total quantity will remain on the sea surface, whilst the majority will have evaporated (56.5%) or will remain dispersed in the water column (28.9%). Furthermore, 8.8% is predicted to have undergone biodegradation, 0.4% to have reached the seabed and 5.2% to have reached the shoreline. The results demonstrate that the behaviour of MGO is characterised primarily by rapid decomposition and dispersion.

As mentioned above, the modelling results represent a conservative estimate (i.e. the most pessimistic scenario), given that they do not take into account response and clean-up measures, such as containment, recovery and measures to protect the coastline, which in a real-life scenario could further reduce the extent and duration of the oil spill.

The assessment also examined the Escape, Evacuation and Rescue (Escape, Evacuation and Rescue – EER) of the Stena DrillMAX, as well as the capacity of the Totally Enclosed Motor Propelled Survival Craft (TEMPSC). Specifically, the capacity of the TEMPSCs has been reduced from 60 to 54 persons, and an additional TEMPSC with a capacity of 60 persons has been installed at the stern of the drilling vessel. This arrangement ensures that the complete evacuation of personnel remains feasible even in the event of the loss of evacuation means on one side of the vessel.

Although a prolonged, uncontrolled subsea blowout is not considered a representative environmental scenario for the exploratory drilling operation, the planned emergency control arrangements for the wellhead will be maintained. These include intervention in the Blowout Preventer (BOP) via secondary control systems, standby activation of the E-SID, capping the well, containment and planning for a relief well.

Overall, the QRA confirms that the risks associated with the proposed exploratory well

‘Asopos-1’ are lower than those of the conservative base case for the Stena DrillMAX and meet the applicable risk acceptance criteria. The implementation of existing safety measures, in conjunction with project-specific measures – and in particular the K-BOS E-SID – demonstrates the reduction of risks in accordance with the ALARP principle. The assumptions regarding the number of persons on board (POB), the distribution of personnel and exposure from helicopter transport will be verified against the final staffing and logistics support plan prior to the commencement of works, and the risk results will be reviewed in the event of material discrepancies.

## 2.8 Assessment and evaluation of environmental and social impacts

### 2.8.1 Identification and assessment of significant environmental parameters

The Environmental and Social Impact Assessment (ESIA) process initially requires the classification of the parameters of the natural and man-made environment affected by the impacts into significant or noteworthy elements, defined as Significant Environmental Parameters (SEPs). An SEP is defined as any element of the natural and man-made environment considered significant by the parties involved in the assessment, authorisation and implementation of the project under consideration (project promoter, competent

authorities and agencies, consultants, other parties directly or indirectly involved in or affected by the project's implementation, etc.).

The SPPs are categorised taking into account their environmental value, as derived from the data presented in Chapter 8 of the Current State of the Environment, and – where possible – their sensitivity to the project's activities.

On this basis, the SPPs are categorised as Low, Medium and High Significance. The significance of each EPI is taken into account as a weighting factor in the final weighting of impacts during the EIA process, as described in Section 10.1.1.3.2. In this way, the same impact is ultimately assessed as more significant in relation to a High-Significance Environmental Parameter than in relation to a Low-Significance Environmental Parameter.

**Table 2-3: Identification and Assessment of Significant Environmental Parameters in the study area**

| SIGNIFICANT ENVIRONMENTAL PARAMETER (SEP)                   |                                      | SIGNIFICANCE OF SEM | ASSESSMENT                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------------------------------------------------|--------------------------------------|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Climatic and bioclimatic characteristics                    | Climate, microclimate and bioclimate | Moderate            | The climate and weather conditions are important factors affecting the safety of drilling operations, the movement of vessels, helicopter flights and the planning of emergency response measures, as well as the overall operation of the Project. However, the temporary offshore drilling campaign is not expected to cause any measurable changes to the regional climate, the microclimate or bioclimatic conditions.                    |
|                                                             | Climate change                       | High                | Climate change is an extremely important environmental factor due to the contribution of greenhouse gas emissions from the mobile offshore drilling unit (MODU), support vessels and helicopter flights. Although emissions from the Project are temporary and of limited duration, they contribute cumulatively to a global environmental issue of international significance and are therefore considered a factor of very high importance. |
| Morphological and topological characteristics               | Morphology                           | Moderate            | The morphology of the seabed is a significant receptor, as drilling activities involve direct interaction with the seabed at the drilling site. However, the impacts are expected to be largely localised and temporary, with no dredging, backfilling, use of an anchoring system or permanent alteration to the morphology of the seabed or the coastal zone.                                                                               |
|                                                             | Landscape                            | Low                 | The drilling site is located approximately 44 km offshore and no permanent structures will be installed, either offshore or onshore. The visual impacts associated with the Mobile Offshore Drilling Unit (MODU), support vessels and helicopter movements will be temporary and largely confined to distant sea views offshore, resulting in limited interaction with landscape receptors.                                                   |
| Geological, tectonic and soil characteristics of the seabed | Geology and slope stability          | Moderate            | The Project involves drilling through geological formations and, as such, interacts directly with the subsoil. However, the impacts are limited to a very small area around the borehole and no significant change in the geological conditions of the wider area is expected.                                                                                                                                                                |
|                                                             | Tectonics and seismicity             | Moderate            | The Project is located in a seismically active area of the Eastern Mediterranean, which makes seismicity an important factor for design and safety. However,                                                                                                                                                                                                                                                                                  |

| SIGNIFICANT ENVIRONMENTAL PARAMETER (SEP) |                                                   | SIGNIFICANCE OF SEM | ASSESSMENT                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------------------------|---------------------------------------------------|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                           |                                                   |                     | drilling operations are not expected to trigger seismic events.                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|                                           | Soil                                              | Low                 | No use of land, excavation or ground intervention is required, as the Project is entirely offshore and supported by existing infrastructure.                                                                                                                                                                                                                                                                                                                                                      |
|                                           | Seabed                                            | Moderate            | The installation and operation of the well, the discharge of permitted materials associated with the well, and the presence of the BOP system and the riser, interact directly with the seabed environment, although the impacts are expected to be localised and temporary.                                                                                                                                                                                                                      |
| Terrestrial habitats                      | Terrestrial habitats – vegetation                 | Low                 | No vegetation clearance, land occupation or disturbance of terrestrial habitats is required.                                                                                                                                                                                                                                                                                                                                                                                                      |
|                                           | Terrestrial fauna (excluding birdlife)            | Low                 | No direct interaction with terrestrial fauna is expected due to the absence of new terrestrial infrastructure.                                                                                                                                                                                                                                                                                                                                                                                    |
| Marine habitats                           | Marine habitats – underwater vegetation and flora | Moderate            | Marine habitats are a sensitive environmental receptor, as drilling activities take place within the marine environment and may cause localised disturbance to the seabed and temporary changes in water quality.                                                                                                                                                                                                                                                                                 |
|                                           | Marine fauna                                      | High                | Marine mammals, sea turtles, fish and other marine species are among the most sensitive receptors that may be affected by ship traffic, underwater noise, lighting and any accidents.                                                                                                                                                                                                                                                                                                             |
| Birdlife                                  | Birdlife                                          | Moderate            | Seabirds and migratory bird species may be affected by lighting from ships and the Mobile Offshore Drilling Unit (MODU), as well as by helicopter flights; however, the impacts are expected to be temporary and localised.                                                                                                                                                                                                                                                                       |
| Protected areas                           | Protected areas                                   | High                | The wider study area includes international, European and national protected areas and protected species, a fact which makes these protected areas extremely sensitive environmental receptors, despite the offshore location of the drilling site. However, the drilling site is located tens of kilometres away from protected areas.                                                                                                                                                           |
|                                           | Forests and woodland areas                        | Low                 | No interaction with forested areas is anticipated.                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|                                           | Other significant natural areas                   | High                | The wider area contains ecologically significant marine and coastal areas, which may be home to protected species and habitats.                                                                                                                                                                                                                                                                                                                                                                   |
| Anthropogenic environment                 | Spatial planning and land use                     | Moderate            | Plot 2 does not contain any permanent settlements or land uses, whilst land-based activities are limited to the existing operational facilities at the Port of Igoumenitsa and Corfu International Airport, without any land take or change in land use. However, the Project is directly related to the Regional Spatial Planning Framework for the Ionian Islands, which identifies offshore hydrocarbon exploration as an activity of national importance subject to environmental safeguards. |
|                                           | Marine uses                                       | High                | The wider study area is characterised by intensive marine uses, including commercial shipping, fishing, subsea cables, aquaculture, tourism and recreation. Shipping and commercial fishing have the greatest spatial interaction with the Project due to the temporary exclusion zone for safety reasons and the movements of support vessels, making marine uses an extremely important environmental receptor.                                                                                 |
|                                           | Structure and functions of the                    | Low                 | The Project's activities are confined to existing port and airport facilities and do not require new                                                                                                                                                                                                                                                                                                                                                                                              |

| SIGNIFICANT ENVIRONMENTAL PARAMETER (SEP) |                                                                           | SIGNIFICANCE OF SEM | ASSESSMENT                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------------------------------|---------------------------------------------------------------------------|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                           | man-made environment                                                      |                     | infrastructure, land take or permanent land occupation. Consequently, no fragmentation of the settlement structure, the urban fabric or existing land uses is anticipated.                                                                                                                                                                                                                                                                                                                                                                                                                          |
|                                           | Cultural heritage                                                         | High                | The project area is situated within a zone of recognised marine archaeological significance, and marine surveys have identified a feature interpreted as a probable ancient shipwreck (Target T057) within the survey area, 8.6 kilometres from the drilling site. Although terrestrial cultural heritage sites are located outside the project area, the possible presence of an underwater cultural heritage feature makes this area extremely sensitive, requiring mitigation and protection measures.                                                                                           |
| Socio-economic environment                | Economic activities                                                       | High                | The Project interacts with regional economic activities, in particular commercial fishing, tourism, port services, logistics and local supply chains. The Project has the potential to make a positive contribution to the Greek economy through investment, employment, procurement and increased demand for local and regional goods and services.                                                                                                                                                                                                                                                |
|                                           | Community health and safety                                               | High                | Community health and safety are extremely important factors, given the presence of existing settlements and active transport infrastructure, including the existing airport, port and maritime traffic. The Project will interact with these existing transport activities through the port logistics base, helicopter flights and the movements of the floating drilling unit as well as support vessels. However, the offshore location of the drilling site is approximately 44 km from the nearest communities, thereby limiting the likelihood of direct interaction with the wider community. |
| Social infrastructure                     | Social infrastructure                                                     | Low                 | The Project will use existing health and emergency services only occasionally and does not require the construction of new social infrastructure or the expansion of existing facilities. Demand on the existing capacity of these services is expected to be negligible.                                                                                                                                                                                                                                                                                                                           |
| Technical infrastructure                  | Maritime infrastructure / Navigation infrastructure                       | High                | The project area is situated within active offshore navigation routes in the Ionian Sea. The temporary establishment of a 500-metre safety zone around the floating drilling unit, as well as the increased traffic of support vessels (PSVs), poses a risk of interference with commercial shipping routes. However, the impacts are temporary, limited to the local area and are managed through the established maritime safety procedures (such as NAVTEX, Notices to Mariners and support from vessels, where available).                                                                      |
|                                           | Other transport infrastructure (road, port, airport, logistics corridors) | Moderate            | The Project utilises existing land-based infrastructure, including the Port of Igoumenitsa and Corfu International Airport, without requiring any new construction or expansion of their capacity. The interactions are operational and temporary, and relate to crew transport, the supply chain and mobilisation/demobilisation activities.                                                                                                                                                                                                                                                       |
|                                           | Energy and telecommunications infrastructure                              | Low                 | The Project utilises existing onshore energy and telecommunications infrastructure, without requiring any expansion of capacity.                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|                                           | Environmental infrastructure                                              | Moderate            | The Project will not rely on municipal or port waste and sewage management services for the treatment                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| SIGNIFICANT ENVIRONMENTAL PARAMETER (SEP) |                                                       | SIGNIFICANCE OF SEM | ASSESSMENT                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------------------------------|-------------------------------------------------------|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                           | (waste, sewage, spill response, reception facilities) |                     | or disposal of waste and sewage. Instead, waste requiring transport to shore will be transported directly via the onshore support base to authorised regional facilities, in accordance with the Project's Waste Management Plan and applicable national legislation. Wastewater generated on the floating drilling unit and the Project's vessels will be managed by the relevant operating body in accordance with applicable maritime requirements, vessel-specific systems and the Project's environmental requirements. |
| Atmospheric environment                   | Air quality                                           | Moderate            | Emissions from the floating drilling unit, support vessels and helicopters will occur throughout the drilling phase and constitute one of the project's main operational interactions with the environment. However, the impacts are expected to be temporary and to be dispersed across the offshore area.                                                                                                                                                                                                                  |
| Acoustic environment                      | Ambient noise                                         | Moderate            | Noise will be generated by drilling operations, vessels and helicopters, but the impacts will be temporary and largely confined to workers in the offshore area and to those passing through this maritime area.                                                                                                                                                                                                                                                                                                             |
|                                           | Underwater noise                                      | High                | Underwater noise is a key environmental impact factor due to the presence of marine mammals, sea turtles, fish and other species of sensitive marine fauna in the wider Ionian Sea region.                                                                                                                                                                                                                                                                                                                                   |
|                                           | Vibrations                                            | Low                 | The impacts of drilling-related vibrations are expected to remain locally confined to the immediate vicinity of the drilling site and are not anticipated to affect receptors in the wider area.                                                                                                                                                                                                                                                                                                                             |
|                                           | Electromagnetic radiation                             | Low                 | The Project does not involve any significant sources of electromagnetic emissions beyond the standard communications and operational equipment used at offshore installations.                                                                                                                                                                                                                                                                                                                                               |
| Water                                     | Seawater                                              | High                | Seawater is a primary environmental receptor due to the offshore nature of the Project and the possibility of operational discharges, accidental spills and interactions with the quality of marine waters.                                                                                                                                                                                                                                                                                                                  |
|                                           | Surface waters                                        | Low                 | No direct interaction with surface waters is anticipated, as no new onshore infrastructure or freshwater abstraction is required.                                                                                                                                                                                                                                                                                                                                                                                            |
|                                           | Groundwater                                           | Low                 | Due to the offshore location of the Project and the absence of onshore construction activities, no direct impact on groundwater resources is expected.                                                                                                                                                                                                                                                                                                                                                                       |

## 2.8.2 Assessment of potentially significant impacts from the normal / routine activities of the project

This section summarises the environmental and social impacts arising from the normal (routine) operation of the Project. The summary is based on the detailed assessments presented in the previous sections and sets out the relative significance of the impacts and the residual significance following the implementation of the proposed mitigation measures.

Table 2-4: Summary of impacts from the normal/routine operation of the project

| Environmental & Social Parameters             | Valued Receptors         | Project Activities / Elements                                                                                                   | Nature (S) | Intensity (IN) | Extent (EX) | Moment (MO) | Persistence (PE) | Reversibility (RV) | Synergy (SI) | Effect (EF) | Periodicity (PR) | Recovery (MC) | Accumulation (AC) | Impact Magnitude (Im) |            | Valued Receptor Assessment | Impact Significance | Final Residual Impact Evaluation |
|-----------------------------------------------|--------------------------|---------------------------------------------------------------------------------------------------------------------------------|------------|----------------|-------------|-------------|------------------|--------------------|--------------|-------------|------------------|---------------|-------------------|-----------------------|------------|----------------------------|---------------------|----------------------------------|

## 2.9 Assessment of cumulative/synergistic effects

This section assesses the likelihood that the impacts of the Project will interact with or be added to the impacts of other existing, approved or planned permitted and/or planned projects and/or activities in the wider northern Ionian Sea and adjacent coastal areas. The assessment focuses on activities that may overlap with the Project spatially and/or temporally, or that may affect the same environmental and social receptors, namely marine water quality, seabed habitats, marine fauna, fisheries, shipping, air quality, underwater noise, technical infrastructure and existing marine uses.

The assessment takes into account the current framework for maritime spatial planning, existing maritime uses and anticipated offshore activities in the wider study area. The project area is located within Spatial Unit 4 of the National Spatial Strategy for the Maritime Space (NSSMS); given that the detailed Maritime Spatial Planning Frameworks for this unit have not yet been finalised, the cumulative assessment was also based on existing national, regional and sectoral spatial planning instruments relating to shipping, fisheries, aquaculture, tourism, offshore infrastructure, renewable energy sources (RES) and, in particular, offshore wind farms currently at the licensing and development stage within the Italian EEZ, as well as development areas on the Greek side that are at the programme approval stage, and the development of the energy sector.

### 2.9.1 Commercial shipping, ferry services and international shipping

Commercial shipping and maritime traffic are among the main existing maritime uses with the potential to interact with the Project during its implementation period. The Ionian Sea is an important maritime corridor linking the Adriatic Sea, the central Mediterranean, the Suez Canal route and the wider Black Sea region, whilst existing traffic includes cargo ships, tankers, international passenger ferries, cruise ships and other commercial traffic, particularly along the routes linking the Italian ports on the Adriatic with Igoumenitsa, Patras and other Greek ports. Furthermore, in the context of the most recent geopolitical developments in the Persian Gulf and the Middle East (military operations in the south-eastern Mediterranean and the Persian Gulf), the Adriatic Sea is also used by warships. The maritime area west of Corfu, including the wider area of Section 2, falls within a zone of moderate to high shipping traffic, although the regional shipping lanes with the highest density are concentrated further west of Corfu and follow a broader north-west to south-east direction.

Figure 2-1: Average shipping traffic density (all vessel types), 2017–2024, in the Ionian Sea and the wider project area

The Project may interact cumulatively with these activities through the establishment of the 500 m safety zone, the temporary presence of the floating drilling unit and the movements of support vessels between the Port of Igoumenitsa and the location of the exploratory well

‘Asopos-1’. These interactions may require temporary notification of passing vessels regarding their route and could marginally increase local maritime traffic during mobilisation, drilling support and demobilisation (de-mobilisation). However, given the short-term and spatially limited nature of the Project, as well as the maritime safety measures to be implemented – including Notices to Mariners, NAVTEX messages, vessel coordination procedures and standard maritime safety practices – the cumulative impacts on commercial shipping and ferry services are expected to be minor, temporary and reversible.

Potential synergistic effects may arise when the movements of the Project’s vessels coincide with existing traffic of cargo ships, tankers or cruise ships, particularly in adverse weather conditions or when visibility is reduced. These impacts, however, are operational rather than environmental in nature and will be addressed through maritime coordination and navigation safety procedures. Consequently, no significant cumulative impact on international shipping is anticipated.

## 2.9.2 Commercial fishing and fishing grounds

Cumulative impacts on fisheries may arise when pressures associated with the Project are added to existing pressures from commercial fishing vessels operating in or transiting through the wider western Ionian Sea region. The main pressures common to both activities are underwater noise, the presence of vessels, artificial lighting, atmospheric emissions, minor discharges and local disturbance to marine fauna and seabed conditions.

Figure 2-2: GFCM restricted fishing areas in the wider project area<sup>5</sup>

During the drilling campaign, the floating drilling rig and support vessels may temporarily increase overall vessel activity and underwater noise levels in the area surrounding the 'Asopos-1' exploration well site. Where this coincides with fishing vessel activity, it may cause short-term cumulative disturbance to marine fauna, mainly due to vessel noise, manoeuvres, lighting and human activity. Fishing activities may also cause local disturbance to the seabed or resuspension of sediments, which could exacerbate the local impacts of discharges associated with the Project's exploratory drilling and interaction with the seabed.

Synergistic effects are considered likely to occur when fishing activities and Project operations take place simultaneously and affect the same receptors, primarily marine fauna and the complexity of navigation, as the combined presence of fishing vessels, support vessels and the safety zone around the floating drilling unit could temporarily increase disturbance or operational pressure in the immediate offshore area. However, such impacts would be highly localised and short-term. Given that the bulk of fishing activity in the wider western Ionian Sea is concentrated mainly in coastal waters, whilst the Project's footprint is limited to a temporary offshore area of operations, the cumulative and synergistic impacts on fisheries are expected to be negligible to minor, temporary and reversible.

<sup>5</sup> <https://www.fao.org/gfcm/data/maps/fras/en/> (edited by: LDK)

### 2.9.3 Maritime tourism, recreational boating and cruises

Maritime tourism and recreational boating, including the hire of recreational craft and sailing, coastal cruises, recreational boating and cruising, are well established throughout the wider Ionian Sea, concentrated mainly around Corfu, Paxos, Antipaxos, the Diapontia Islands and the coast of Epirus (Error! Reference source not found. ). The main recreational boating routes are in coastal and inter-island waters, whilst the 'Asopos-1' exploratory well is located in offshore waters some distance from the main areas of concentration and movement.

**Figure 2-3:** Density of sailing, recreational and high-speed vessels (Annual average 2017–2024)<sup>6</sup>

A potential cumulative interaction could arise in cases where pleasure craft or cruise ships undertake longer offshore voyages between Greece and Italy and pass through the wider Project area; such interactions would be limited to temporary awareness of vessel movements and avoidance of the 500-metre safety zone. The Project is not expected to affect the main recreational sailing routes, coastal cruise areas, approaches to cruise ports or tourist destinations.

Potential synergistic effects could arise if shipping traffic associated with the Project coincides with the peak tourist season, when the density of recreational craft is highest throughout the Ionian region. However, given that recreational activity is mainly concentrated in the coastal zone, whilst the Project is located offshore, these impacts are expected to be limited. No significant cumulative or synergistic impacts on marine tourism, recreational activities or cruises are anticipated.

### 2.9.4 Aquaculture activities

<sup>6</sup> <https://EMODnet.ec.europa.eu/geoviewer/>

Aquaculture is an established but spatially limited marine use within the wider study area. Marine fish farming takes place along the north-eastern coast of Corfu and the coastline of Thesprotia, including designated or planned aquaculture development areas. These activities are concentrated in protected coastal waters and are spatially distinct from the open waters of Section 2 and the proposed location of the 'Asopos-1' borehole. There are no aquaculture facilities, nor are any planned, within the Project's onshore support area at the Port of Igoumenitsa. The distribution of aquaculture facilities within the wider study area is shown in the Figure below.

Figure 2-4: Distribution of aquaculture facilities in the wider study area <sup>7</sup>

Potential cumulative impacts could include changes in seawater quality, interactions with vessel traffic or incidents of accidental pollution. However, routine discharges from the boreholes will take place offshore and are expected to be rapidly diluted and dispersed, whilst the Project's support activities rely on existing maritime access routes and existing port facilities. Given that the location of the exploratory well is a considerable distance from existing aquaculture areas, with no direct spatial overlap, no significant cumulative impact is expected.

Potential synergistic impacts on aquaculture would only be possible in the event of a major accidental spill capable of reaching coastal waters, provided that no mitigation measures are taken. Such scenarios do not fall within the scope of normal operations and are addressed separately through emergency preparedness,

<sup>7</sup> <https://EMODnet.ec.europa.eu/geoviewer/>

oil spill contingency planning and the assessment of accidental events. Under normal operating conditions, no significant cumulative or synergistic effects on aquaculture are expected.

### 2.9.5 Submarine telecommunications and power cables

---

Submarine cables constitute a permanent technical infrastructure of strategic importance in the Ionian Sea. Various international telecommunications cable systems connect Greece, Italy and other Mediterranean countries, whilst submarine electricity infrastructure also exists in the wider region, concentrated along corridors crossing the central and southern Ionian basin between the coasts of Italy and Greece. The spatial analysis carried out for the Project has identified three cable systems within the study area that are directly relevant to the Project:

- Eagle (under planning), a new trans-Mediterranean cable system connecting Egypt, Albania and Italy;
- Jonah (in operation since 2012), which connects Israel and Italy via the Eastern Mediterranean and the Ionian Sea;
- Asia Africa Europe-1 (AAE-1) (in operation since 2017), a major international telecommunications cable system linking Asia, Africa and Europe, with landing points including Bari (Italy).

Their location in relation to the 'Asopos-1A' exploratory well is shown in the Figure below.

Figure 2-5: Subsea cables in relation to the project area: (a) Eagle, Jonah,<sup>8</sup> and (b) OTEGlobe Kokkini-Bari subsea cable systems

The location of the ‘Asopos-1’ exploratory well is at least 2,692 m from the cables identified within the study area, the nearest being the AAE-1 cable on the south-western side of the area investigated. The assessment took into account the potential for interaction with this infrastructure, particularly with regard to seabed disturbance, the location of the floating drilling unit, the operations of support vessels and emergency response activities.

The Project does not involve anchoring, trenching, the installation of pipelines or permanent subsea infrastructure. The floating drilling unit will operate using dynamic positioning, and the drilling area is limited to the well site and the immediate operational area. The cable routes will be verified against official nautical charts prior to works and, where required, against information provided by cable operators. Provided that

<sup>8</sup> <https://www.submarinecablemap.com>

standard avoidance and notification procedures are followed, no cumulative impact on subsea cable infrastructure is anticipated.

Potential synergistic effects may arise if the activities of the Project's support vessels, other marine works or emergency operations coincide near the cable corridors. However, given that no seabed intervention is planned along the cable routes and no cable route is expected to cross the operational area, such impacts are considered unlikely and insignificant.

## 2.9.6 Offshore oil and gas installations

The available mapped data on existing offshore oil and gas installations in the wider region indicate that the nearest identified installations are located at a distance of approximately 150 km or more from the proposed location of the 'Asopos-1', concentrated mainly along the Italian coast and in more remote parts of the Adriatic and the central Mediterranean. No comparable operational offshore oil and gas installations have been identified in the immediate vicinity of the area where the exploratory well 'Asopos-1'

Figure 2-6: Offshore oil and gas installations (source: EMODnet)

Potential cumulative interactions with other offshore oil and gas exploration and/or production activities may include atmospheric emissions, underwater noise, vessel traffic, discharges at sea and interactions during emergency response operations. In practice, these routes are not expected to result in significant cumulative impacts, given the considerable distance separating the nearest identified installations from the location of the 'Asopos-1' exploration well. The work involved in the 'Asopos-1' exploration well will be of short duration and will be limited exclusively to exploration, without production testing, gas flaring, permanent installations, subsea production infrastructure, etc. Any overlap in terms of emissions, underwater noise, vessel activity

or marine discharges with existing offshore oil and gas activities is therefore expected to be very limited, temporary and insignificant.

Similarly, it is considered unlikely that any potential synergistic effects will arise, as operational pressures from existing offshore oil and gas installations are not expected to overlap spatially with the area where the exploratory drilling operations for 'Asopos-1' in such a way as to affect the same receptors simultaneously. Consequently, no significant cumulative or synergistic impact is anticipated in relation to existing offshore oil and gas activities.

### 2.9.7 Offshore wind energy, ocean energy and other offshore renewable energy sources

Renewable energy projects in the open sea, in particular offshore wind energy, are considered to be reasonably foreseeable activities in the wider Ionian Sea and the Greek maritime area. Greece has established a specific regulatory framework for the development of offshore wind farms under Law 4964/2022, under which EDEYEP has been designated as the authority responsible for the planning and management of the development programme, as well as for the designation of Organised Development Areas for Offshore Wind Farms (POAYAP). The draft National Programme for the Development of Offshore Wind Farms (EP-YAP), which was drawn up by EDEYEP and is accompanied by a Strategic Environmental Assessment (SEA, LDK, 2023), identifies a series of initially assessed POAYAPs for medium- and long-term development. In the Ionian Sea, this includes the Diapontia Islands area, which is among the potential areas identified for medium-term development in the draft programme. It should be noted, however, that although the public consultation process for this EIA has been completed and the relevant recommendations regarding environmental conditions have been issued, the relevant Joint Ministerial Decision (JMD) for approval is still pending, which means that the POAYAPs are not certain to be among the final options when and if it is issued.

This Special Area of Conservation is situated north-west of Corfu and is relevant to the Project, given its proximity to the location of the 'Asopos-1' and its potential interaction with existing maritime uses in the wider region of Corfu and the northern Ionian Sea. The area was identified in the EP-YAP plan as a potential site for the development of offshore wind farms; however, as mentioned above, it is not an operational or licensed offshore wind farm.

At the time of the assessment, the NDP-OWF had not yet been formally approved, and the subsequent stages required to define specific OWFODAs, allocate development capacity, select developers through a competitive process and obtain project authorisation had not been completed.

Consequently, and overall, there is no sufficiently defined or approved offshore wind energy project in the area of the 'Asopos-1', for which it could reasonably be expected that its construction or operation would overlap with the approximately 90-day exploratory drilling campaign.

The offshore wind farm in the Diapontia Islands remains at the planning stage – initially involving the selection of a broader development area – and the exact boundaries, its design, licensing, contractor and construction programme have not yet been finalised; consequently, the likelihood of temporal and spatial overlap with the Project is currently considered to be zero.

The possibility of cumulative impacts from offshore wind energy projects in adjacent Italian waters has also been examined; such impacts would mainly concern navigation, vessel traffic, fishing, underwater noise and the coordination of emergency response. Given the geographical distance from the Project and the absence of any identified construction or operational activities expected to overlap with the Project period, no significant cumulative or synergistic impacts are anticipated. Most other mapped offshore wind farm and ocean energy projects are located considerably further away, mainly along the Italian coastline and elsewhere in the central Mediterranean.

**Figure 2-7: Offshore wind farms and marine energy projects (Source: EMODnet)**

As no existing or even under-construction offshore wind farm or marine energy project has been identified in the immediate vicinity of the Project, no current cumulative interaction is expected. Should offshore renewable energy projects proceed in the wider area in the future, potential cumulative impacts may arise in relation to vessel traffic, seabed disturbance, underwater noise, the displacement of fishing activities, maritime spatial planning, the coordination of emergency response, and visual or navigational aspects.

Potential cumulative impacts could arise in the future if construction activities for offshore renewable energy sources – such as seabed preparation, cable laying or wind turbine foundation works – were carried out simultaneously with exploratory drilling or other offshore activities, with potential impacts on marine fauna, fisheries and shipping. However, based on the current status of the mapped projects and the short duration of the work involved in the ‘Asopos-1’ exploratory drilling ‘Asopos-1’, no significant cumulative or synergistic impacts are anticipated at this stage in relation to offshore renewable energy projects.

### 2.9.8 Port activities in Igoumenitsa and land-based support base

The Port of Igoumenitsa is an established international passenger and commercial port. The Project will utilise the existing port infrastructure as a temporary land-based base for mobilisation, resupply, waste disposal, equipment storage, administrative functions and demobilisation – activities which will take place within an existing operational port environment where similar transport, storage, cargo handling and logistics activities are routinely carried out.

The Project will not require any new permanent port infrastructure, port expansion, dredging, land reclamation or upgrades/works to utility networks. Waste will be managed through the Project's Waste Management Plan and by suitably licensed contractors, and not through municipal waste collection or treatment systems. Consequently, the cumulative impacts on port traffic, port infrastructure, cargo handling, vehicle movements, energy and telecommunications networks, as well as environmental infrastructure (including waste transport), are expected to be negligible to minor and temporary.

Potential synergistic impacts may arise when the Project's supply chain coincides with peak periods in ferry operations, commercial freight movements, tourism-related port traffic or other temporary port activities. These interactions will mainly concern operational coordination, traffic management and temporary congestion, rather than long-term environmental impacts, whilst no significant synergistic effect is expected from the port's usual management and planning procedures.

### 2.9.9 Military exercise areas and restricted-access maritime zones

Military exercise areas and temporary restricted-access maritime zones are relevant to offshore activities, as they may impose temporary restrictions on navigation or offshore activities. According to information provided by the Hellenic Navy Hydrographic Service, there are no permanently designated exercise areas, nor are there any temporary restricted-access or exclusion zones currently in force via NAVTEX broadcasts and/or Notices to Mariners (NtMs) within the boundaries of Section 2.

Consequently, no cumulative interaction between the Project and the military exercise areas is currently anticipated. Should temporary military restrictions be imposed during the drilling operations, any potential interactions will be addressed through standard maritime coordination procedures and operational planning. No significant cumulative or synergistic effects are anticipated under current conditions.

### 2.9.10 Combined synergistic effects on shared receptors

In addition to the cumulative impacts specifically related to the activity, the assessment examined whether multiple pressures could be exerted simultaneously on the same receptor.

#### Marine fauna

Potential synergistic factors include the combined effect of underwater noise from the floating drilling unit, the dynamic positioning system, support vessels and existing commercial shipping, combined with the presence of vessels, lighting and temporary disturbance. These pressures may lead to temporary avoidance behaviour by sensitive marine species, particularly marine mammals and sea turtles. However, given the absence of noise from pile driving or long-term construction noise, the temporary nature of the drilling campaign and the offshore location of the well, the likelihood of significant cumulative effects is limited.

### Air quality and climate change

Potential cumulative effects relate to the combined emissions from the floating drilling rig, support vessels, helicopters, port activities and existing regional shipping, which collectively contribute to regional air pollutant loads and global greenhouse gas emissions. However, the project's emissions are temporary, occur offshore and are dispersed under open-sea weather conditions.

### Users of maritime transport

Potential synergistic effects may arise where the temporary safety zone, the movements of project vessels, commercial shipping, fishing activities and recreational boating occur simultaneously. These impacts will be managed through maritime notifications, coordination with the relevant authorities and standard vessel traffic procedures. Given that the safety zone will be of limited size and the operational period short, the combined impacts on access and navigation are expected to be minor.

Overall, the Project is likely to interact cumulatively with existing shipping, fishing, offshore routes, port logistics, subsea infrastructure and foreseeable offshore energy developments, with potential synergistic effects relating primarily to underwater noise, vessel traffic, atmospheric emissions and the temporary displacement of fishing activities. However, given the temporary nature of the exploratory drilling campaign, the absence of permanent offshore infrastructure, the limited spatial footprint, the use of existing logistics infrastructure and the implementation of mitigation and management measures, the Project is not expected to cause significant cumulative or synergistic impacts. The remaining cumulative and synergistic impacts are assessed as negligible to minor, local, temporary and reversible.

## 2.10 Assessment of transboundary environmental impacts

In accordance with the Espoo Convention, the UNECE Practical Guide on the Implementation of the Espoo Convention and the EU Directive on Environmental Impact Assessment (Directive 2011/92/EU, as amended by Directive 2014/52/EU), the assessment adopted a precautionary approach when evaluating potential transboundary impacts. Should the competent authority consider that the Project is likely to cause significant adverse transboundary impacts, or should a potentially affected Party request to participate, the procedures for formal notification, exchange of information, consultation and public participation provided for in the Espoo Convention shall apply before any final decision on the Project is taken. This will ensure that all potentially affected Parties have an adequate opportunity to examine the environmental information, submit comments and participate in the decision-making process.

### 2.10.1 Geographical boundaries of the area of operation

The 'Asopos-1' exploration well is located within Area 2 of the Greek Exclusive Economic Zone (EEZ) in the northern Ionian Sea, under Greek jurisdiction. The Project comprises both offshore and onshore components, including offshore drilling operations carried out by the Floating Drilling Unit, maritime logistics between the drilling site and the Port of Igoumenitsa, helicopter transfers between Corfu International Airport and the floating drilling unit, as well as the temporary logistics support facilities that have been set up within the Port of Igoumenitsa.

The offshore operations area is situated in the immediate vicinity of the internationally agreed maritime boundary between Greece and Italy. The drilling site is situated approximately 3.16 km (1.71 nautical miles) east of the boundary of the Greece–Italy Exclusive Economic Zone (EEZ), which makes Italy the nearest potentially affected party under the Espoo Convention.

The nearest Italian coastline is Punta Ristola (Santa Maria di Leuca) in the region of Apulia, which is situated approximately 54.9 km (29.7 nautical miles) west of the proposed drilling location. The nearest Greek mainland is the western coast of the island of Othoni, approximately 44.3 km (23.9 nautical miles) from the drilling site. Logistical support for the offshore operations will be provided from the port of Igoumenitsa, which is situated approximately 129.4 km from the drilling site by sea, whilst helicopter transfers will take place between Corfu International Airport and the mobile drilling unit (MODU), a distance of approximately 81.9 km as the crow flies.

The geographical scope of the transboundary assessment extends beyond the immediate footprint of the Project and takes into account the wider marine environment of the northern Ionian Sea, including the adjacent Italian EEZ. Marine currents, atmospheric dispersion, vessel movements and accidents are not confined by administrative boundaries. Consequently, the assessment examines both the direct and indirect pathways through which the Project's activities could potentially affect environmental receptors located within Italian jurisdiction.

Given the relatively short distance from the international maritime border, transboundary aspects have been integrated throughout the EIA, adopting a precautionary and conservative approach, despite the expectation that the Project's normal activities will remain at a highly local level.

A statutory safety zone of 500 m will be established around the floating drilling unit throughout the duration of drilling operations and the decommissioning of the well, in accordance with the United Nations Convention on the Law of the Sea (UNCLOS), applicable Greek legislation and internationally accepted safety practices on the high seas. The safety zone will be centred on the drilling rig and will remain entirely within Greek jurisdiction. Access to the exclusion zone will be restricted to authorised Project vessels and personnel engaged in drilling operations, logistical support, emergency response or regulatory inspections.

Prior to the commencement of operations, the relevant authorities will issue appropriate Notices to Mariners, navigation warnings and updates to hydrographic publications, in order to inform merchant vessels, fishing vessels and other maritime users regarding the temporary exclusion zone. The vessel traffic management procedures to be implemented as part of the Project will ensure safe interaction with existing shipping routes and minimise disruption to international shipping.

The safety zone will cover only a small area compared with the surrounding marine environment and will apply only for the duration of the drilling and abandonment works. Consequently, no significant restrictions on international shipping or fishing activities within Italian waters are expected.

## 2.10.2 Expected transboundary environmental impacts

The assessment systematically examined all possible pathways through which the Project's activities could cause transboundary environmental impacts, taking into account the location of the Exploration Well at a distance of approximately 3.16 km from the boundaries of the Greek-Italy, the temporary nature of the drilling campaign, the characteristics of the host environment, and the natural processes governing the transport

and dispersion of pollutants in the marine and atmospheric environments. The assessment also took into account the nature, magnitude, spatial extent, duration and reversibility of the potential impacts, as well as the built-in mitigation measures included in the Project's design.

The environmental impacts associated with the Project are primarily short-term and temporary, reflecting the exploratory nature of the activity. The impacts are limited to the duration of mobilisation, drilling, well abandonment and demobilisation, and include temporary underwater noise, gas emissions during operations, vessel traffic, limited disturbance to the seabed, routine marine discharges and temporary occupation of the drilling site. These impacts will cease once drilling operations have been completed and the floating drilling unit has been removed.

#### 2.10.2.1 Seawater quality

Routine discharges include drilling fluids – water-based muds and drilling cuttings, cooling water, desalination brine, ballast water, sanitary effluent, food waste and other permitted operational discharges managed in accordance with applicable international and national requirements.

The assessment took into account the physical and chemical characteristics of these discharges, as well as the prevailing hydrodynamic conditions, dilution and dispersion processes. These materials are discharged in accordance with the applicable regulatory requirements and undergo rapid dilution and dispersion within the receiving marine environment.

Numerical modelling of drilling discharges into the water column / seawater predicts a relatively extensive but temporary dispersion area which, in some cases, may exceed the distance between the drilling site and the Italian EEZ, as mentioned previously in the relevant sections presenting the cuttings dispersion model. However, this scenario represents the maximum cumulative area in which a single cell of the model exceeded the control limit at any point during the 45-day simulation. It does not represent a continuous impact, nor does it represent an environmental burden.

Any such impact is expected to be temporary, reversible and limited to the discharge period and the short dispersion phase following discharge. The modelling concludes that environmental risks in the water column are expected to cease within a few days after the end of discharges from the well. Overall, there may be a temporary transboundary impact on marine water quality; however, this is expected to be short-term, be confined to the water column and not be associated with persistent contamination of sediments or long-term impacts on Italian waters.

#### 2.10.2.2 Seabed

Disturbance to the seabed has been assessed in relation to the installation of the riser, well drilling, cementing operations, the disposal of permitted drill cuttings and the temporary placement of subsea equipment. These activities result in an extremely localised physical disturbance confined to the immediate vicinity of the well site. The resuspension of sediments caused by drilling and the jetting of water to install the riser is expected to settle rapidly near the wellhead, whilst no dredging, dredging of the seabed or permanent infrastructure on the seabed.

Numerical modelling during drilling indicates that no transboundary impacts on seabed sediments within the Italian EEZ are expected. The predicted significant sediment risk is extremely localised around the discharge point, with a maximum extent of approximately 283 m during Season 1 (October to March) and 397 m during Season 2 (April to September). The simulated exceedances of the sediment sorting limit remained within the Greek EEZ in both scenarios assessed.

**Figure 2-8: Cumulative simulated exceedances of the sediment sorting limit in relation to the boundaries of the Greek and Italian EEZs**

Consequently, no significant cross-border impacts on seabed morphology or benthic habitats are anticipated. Overall, no significant cross-border impact on Italian seabed sediments is anticipated.

### 2.10.2.3 Underwater noise

Sound propagates effectively in the marine environment and may affect highly mobile marine species capable of crossing national maritime borders. Sources of noise include dynamic positioning thrusters, drilling equipment, support vessel operations, ROV activities and vertical seismic profiling (VSP).

The assessment took into account the temporary and intermittent nature of these activities, the relatively low noise levels during drilling operations compared with other offshore activities, and the mobility of marine fauna. Although individual animals may temporarily avoid the immediate vicinity of the drilling rig, no population-level impacts or significant transboundary impacts are anticipated. The underwater noise

generated during drilling operations attenuates with distance and is not expected to cause biologically significant impacts on a transboundary scale.

#### 2.10.2.4 Air quality

---

Atmospheric emissions have been identified as a potential transboundary pathway, as combustion emissions from the floating drilling unit, support vessels, helicopters and onshore supply activities may be dispersed over significant distances, depending on prevailing meteorological conditions. The assessment took into account emissions of greenhouse gases and other atmospheric pollutants, including nitrogen oxides, sulphur oxides, carbon monoxide and particulate matter.

The exploratory drilling campaign will be temporary, and the main sources of emissions will be located offshore, at a considerable distance from coastal receptors. Emissions from the floating drilling rig, support vessels and helicopters will disperse rapidly over the open sea under prevailing meteorological conditions, reducing the likelihood of measurable changes in air quality beyond the immediate operational area. Furthermore, emission levels are limited by the short duration of the drilling campaign, the use of marine fuels that comply with current sulphur content requirements, and the absence of regular combustion sources, such as gas flaring, gas venting or combustion sources associated with production. Consequently, no significant transboundary impacts on air quality are expected.

Greenhouse gas emissions will gradually contribute to global climate change, but do not cause a discernible or measurable impact on air quality in the territory of a neighbouring state.

#### 2.10.2.5 Maritime and air traffic

---

The project's vessels will operate within an area used by international commercial shipping in the northern Ionian Sea. Activities include the mobilisation (mob) and demobilisation (de-mob) of the floating drilling unit, the routine operations of supply vessels, the activities of standby vessels and the occasional presence of specialised support vessels. Temporary interactions with existing shipping lanes will be managed through the establishment of the 500-metre safety zone required by law, Notices to Mariners, NAVTEX broadcasts and standard maritime navigation procedures.

Given that the movements of the vessels will be temporary and will represent a minor addition to existing commercial shipping in the northern Ionian Sea, no significant cross-border impacts on international shipping are expected.

Helicopter flights include regular crew rotations, the delivery of critical equipment and emergency flights between Corfu International Airport and the offshore drilling rig. The frequency of flights is expected to remain relatively low and will generally follow established air routes and operational procedures. Helicopter flights will be limited in number, short in duration and directed exclusively to the offshore drilling unit. Consequently, helicopter flights are not expected to cause any transboundary environmental impacts.

## 2.10.2.6 Waste generation and management

All waste streams generated in the offshore area will be sorted on board, temporarily stored, transported to the onshore support base at the Port of Igoumenitsa, and subsequently transported by licensed contractors to authorised treatment, recovery or disposal facilities, in accordance with the Project's Waste Management Plan and the applicable legislation. There will be no deliberate discharge of waste beyond the permitted operational discharges regulated by the MARPOL Convention, and no cross-border transport of waste from the Project is envisaged. Consequently, routine waste management activities are not expected to cause any transboundary environmental impacts.

## 2.10.2.7 Accidental hydrocarbon spill

The main mechanism through which transboundary environmental impacts could arise would be via low-probability accidental events, in particular a significant hydrocarbon spill. Such scenarios have been assessed separately using specific oil spill modelling presented in Chapter 9. Although the probability of accidental events is very low, the assessment took into account scenarios involving marine diesel spills, chemical spills and loss of control of the wells, recognising that under certain combinations of wind, waves and currents, pollutants could potentially be carried beyond the Greek EEZ. Consequently, the scenarios were assessed separately on the basis of a precautionary approach, supported by oil spill modelling where appropriate, and taking into account the Project's preventive measures, well integrity systems, emergency response arrangements and the oil spill contingency plan. These assessments take into account potential spill trajectories, prevailing oceanographic conditions and response capabilities in accordance with recognised international practice.

With regard to the scenario of an instantaneous surface spill of marine gas oil (MGO) presented in section 10.2.3.1.1, the modelling indicates that any potential transboundary impacts would be limited and short-term. The movement of oil on the surface may occur in different directions depending on seasonal winds and currents; however, the highest probability of occurrence remains close to the site of the spill, and the affected area is limited due to the rapid degradation and evaporation of MGO.

Coastal pollution is predicted as a possibility outside Greek waters, with a low probability. In Phase 1, coastal pollution may occur in five countries between Croatia and Greece, whilst in Phase 2 it may occur in four countries. The highest predicted probability of coastal pollution is observed in Italy, reaching 5 per cent in Season 1 and 12.2 per cent in Season 2. The shortest predicted time to reach the coast is 2.8 days in Italy during Season 1. In all the above cases, the potential pollution at the percentages mentioned is expected only if no mitigation measures are taken, which in practice cannot happen, as the regulatory framework imposes a strong legal obligation to draw up an Emergency Response Plan (ERP), which must be submitted to the competent authorities for assessment and approval.

Overall, the MGO surface spill scenario is likely to cause limited cross-border impacts; however, these will be short-term, of short duration and significantly less severe than scenarios involving a prolonged release of hydrocarbons.

## 2.11 Addressing environmental and social impacts

**Table 2-5: Proposed mitigation measures for potential adverse environmental and social impacts during the drilling preparation and mobilisation phase of the project**

| ENVIRONMENTAL PARAMETERS                 | OBJECTIVE OF MEASURE                                          | MITIGATION MEASURES DURING DRILLING PREPARATION & MOBILISATION                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------------------------------------|---------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Climatic and Bioclimatic Characteristics | Minimise greenhouse gas emissions and air pollutant emissions | 1. Each Project Contractor shall maintain all machinery, vessels, and vehicles used in the Project according to manufacturer specifications to reduce exhaust emissions. Maintenance shall be carried out by the relevant contractor/owner in accordance with manufacturer schedules, at licensed onshore facilities where practicable.                                                                                                                                                                                                                  |
|                                          |                                                               | 2. The MODU and all support vessels shall comply with the requirements of MARPOL 73/78 Convention, Annex VI "Regulations for the Prevention of Air Pollution from Ships". Annex VI regulates emissions of ozone-depleting compounds, nitrogen oxides (NOX), sulfur oxides (SOx) and volatile organic compounds (VOCs).                                                                                                                                                                                                                                   |
|                                          |                                                               | 3. Energean shall coordinate with relevant Contractors, the Port Authority and Corfu International Airport to optimise support vessel and helicopter logistics through careful voyage planning, taking into account rig operational requirements, so as to minimise the number of vessel trips, reduce the duration of activities within the project area, and avoid unnecessary engine operation and idling, to the extent achievable within the operational constraints of each party involved.                                                        |
|                                          |                                                               | 4. Energean shall assess, in coordination with the Port of Igoumenitsa operator and relevant vessel operators, the feasibility of using existing shore-power facilities for Project vessels while alongside. Shore power may be used where existing infrastructure is available and compatible with the vessel, and where the necessary technical, safety, operational and commercial arrangements have been agreed between the relevant parties. The Project does not include installation or substantial upgrading of port shore-power infrastructure. |
|                                          |                                                               | 5. Use LED lighting for interior lighting, where practicable, and avoid unnecessary operation of external lighting.                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| ENVIRONMENTAL PARAMETERS                                 | OBJECTIVE OF MEASURE                                                                | MITIGATION MEASURES DURING DRILLING PREPARATION & MOBILISATION                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------------------------------------------------|-------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Morphological and Landscape Characteristics              | Minimise impacts on landscape characteristics, visual amenity and seabed morphology | 6. The Project shall use existing facilities within the Port of Igoumenitsa and Corfu International Airport. No new permanent onshore or offshore infrastructure, dredging, land reclamation or quay modifications shall be required. All activities shall remain within designated operational areas.                                                                                                                                                                                                                                                                                                                                                                                   |
|                                                          |                                                                                     | 7. Onshore Project support activities at the Port of Igoumenitsa and Corfu International Airport shall be undertaken within the areas allocated or agreed for Project use by the relevant facility operator. Project equipment, materials, vehicles and wastes shall be stored, handled and parked only within designated areas, except when being transported in accordance with applicable logistics and waste-management arrangements. Unauthorised disposal or storage outside the designated Project areas shall be prohibited.                                                                                                                                                     |
|                                                          |                                                                                     | 8. The Project shall use the existing surfaced areas of the onshore logistics base, and no additional permanent impermeable surfacing is planned. If additional surfacing is subsequently required for safe Project operations, it shall be limited to the minimum necessary extent within the area allocated for Project use and shall be subject to prior agreement with the Port operator and any applicable approvals. Any reinstatement requirements shall be agreed with the Port operator.                                                                                                                                                                                        |
| Geological, Tectonic and Soil / Sediment Characteristics | Protect soil /sediment and prevent physical disturbance and contamination           | 9. Hazardous and non-hazardous wastes generated offshore shall be segregated, stored, handled and transferred to authorised shore reception or waste-management facilities in accordance with the Project Waste Management Plan and the applicable requirements of MARPOL, the Barcelona Convention and its Offshore Protocol, and EU and Greek legislation. No solid or hazardous waste shall be intentionally discharged to the marine environment. Operational discharges, including drilling fluids and cuttings, sewage, bilge water, ballast water and food waste, shall be managed in accordance with the relevant discharge-specific measures and applicable legal requirements. |

| ENVIRONMENTAL PARAMETERS | OBJECTIVE OF MEASURE                                            | MITIGATION MEASURES DURING DRILLING PREPARATION & MOBILISATION                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------------------|-----------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                          |                                                                 | 10. Fuel, chemicals and hazardous materials (identified as such under applicable legislation or the relevant Safety Data Sheet) shall be stored in designated areas within the logistics base, equipped with secondary containment and segregation appropriate to the nature, quantity and spill risk of the materials. Suitable spill response materials and equipment shall be readily available at relevant storage, transfer and handling locations, in accordance with applicable site procedures and Project spill-response arrangements.                                                                |
| Air quality              | Protect ambient air quality by minimising atmospheric emissions | 11. Logistics activities, including support vessel operations and the use of onshore vehicles and machinery, shall be planned and managed by the relevant Contractors, in coordination with Energean and the facility operators, to minimise unnecessary engine operation, idling and associated atmospheric emissions, to the extent achievable within operational and scheduling constraints.                                                                                                                                                                                                                |
| Noise and Vibrations     | Minimise underwater and airborne noise and protect marine fauna | <p>12. Material handling and cargo operations at the logistics base shall be undertaken by the relevant Contractors in accordance with the Port of Igoumenitsa operating procedures, using equipment maintained in good working order to minimise unnecessary noise emissions.</p> <p>13. Support vessel operations shall be coordinated by Energean, in collaboration with the relevant Contractors, taking account of the facility operator, vessel and rig operational and safety requirements, to minimise underwater noise and unnecessary engine operation and idling, where reasonably practicable.</p> |

| ENVIRONMENTAL PARAMETERS                                 | OBJECTIVE OF MEASURE                                                              | MITIGATION MEASURES DURING DRILLING PREPARATION & MOBILISATION                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------------------------------------------------|-----------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Seawater                                                 | Protect seawater quality                                                          | <p>14. Offshore-generated hazardous and non-hazardous wastes (identified as such under applicable legislation or the relevant Safety Data Sheet) shall be managed in accordance with the Waste Management Plan and applicable requirements of MARPOL, the Barcelona Convention and its Offshore Protocol, and EU and Greek legislation. Operational discharges shall be managed in accordance with the requirements applicable to each discharge stream, including MARPOL, the BWM Convention, the Barcelona Convention and its Offshore Protocol, and EU and Greek legislation, as relevant. Chemical selection, use and discharge shall be controlled through the Chemical Use Plan.</p> |
| Marine life, Flora, fauna, habitats, and protected areas | Protect marine fauna, and protected species by avoiding or minimising disturbance | <p>15. A Marine Mammal Mitigation Plan (MMMP) shall be prepared prior to the commencement of non-impulsive sound emissions. The MMMP shall set out the mitigation protocol to be implemented by the relevant contractors for the Vertical Seismic Profile (VSP) operation, including visual monitoring by a qualified Marine Mammal Observer (MMO) and, where applicable, Passive Acoustic Monitoring (PAM), to detect marine mammals and manage the risk of injury from impulsive noise prior to and during the VSP.</p>                                                                                                                                                                  |
|                                                          |                                                                                   | <p>16. Project-related vessels shall operate at speeds not exceeding 14 knots, or their maximum operational speed where lower, within areas identified in the Marine Mammal Mitigation Plan as having higher marine mammal presence, without compromising vessel safety or emergency response capability.</p>                                                                                                                                                                                                                                                                                                                                                                              |
|                                                          |                                                                                   | <p>17. Vessels shall maintain a safe distance from any observed marine mammal, avoid approaching it head-on, avoid crossing or waiting ahead of its direction of travel, and, where safe and practicable, steer behind its path.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| ENVIRONMENTAL PARAMETERS  | OBJECTIVE OF MEASURE                                                                                                      | MITIGATION MEASURES DURING DRILLING PREPARATION & MOBILISATION                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                           |                                                                                                                           | 18. In the event of a collision between a Project vessel and a marine mammal or sea turtle, the vessel's Master shall immediately report the incident to Energean in accordance with the Project's incident-reporting procedure. Energean shall, as soon as reasonably practicable and within any applicable regulatory timeframe, formally notify the competent environmental and other relevant authorities, as required by applicable legislation. |
|                           |                                                                                                                           | 19. Established transit routes shall be followed by Project vessels, where practicable, during drilling preparation and mobilisation, in accordance with standard vessel transit procedures, including applicable navigational notifications (e.g., NAVTEX) and coordination with the competent maritime authorities, and subject to the Master's discretion on safety grounds.                                                                       |
|                           |                                                                                                                           | 20. Prior to spudding the well, a remotely operated vehicle (ROV) survey shall be conducted within a 70-metre radius of the planned wellhead location to inspect the seabed for pre-existing features or sensitivities. If any previously unidentified seabed features or sensitivities are observed within the surveyed area, the relevant authorities shall be informed.                                                                            |
| Spatial Planning Land Use | Minimise interference with existing onshore land uses and ensure compliance with applicable spatial planning requirements | 21. Project activities shall be conducted in accordance with the terms of existing operating permits, licenses and land use designations applicable to the Port of Igoumenitsa and Corfu International Airport, and shall not require any change to current spatial planning designations for these areas.                                                                                                                                            |
| Maritime uses             | Minimise impacts on maritime uses                                                                                         | 22. Prior to mobilisation and demobilisation, the Operator shall ensure that the drilling contractor engages with the Hellenic Navy Hydrographic Service regarding the planned drilling and vessel-transit operations, in accordance with standard rig mobilisation procedures. The charting review and the ESSBS confirm that no submarine cables are present within 500 metres of the drilling location.                                            |

| ENVIRONMENTAL PARAMETERS | OBJECTIVE OF MEASURE | MITIGATION MEASURES DURING DRILLING PREPARATION & MOBILISATION                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------------------------|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                          |                      | <p>23. The main operators of cruise ships and LNG carriers identified through the Shipping and Navigation Assessment as regularly passing within or near 500 m of the site shall be provided with advance notice of the Asopus-1 operations. This notice shall supplement applicable official navigational notifications, including NAVTEX messages and Notices to Mariners, enabling the vessel operators to review or amend their passage plans, if required.</p> <p>24. The OIM/Master of the MODU and the Master of each support vessel shall have overriding authority and responsibility to make decisions with respect to safety and pollution prevention, in accordance with the ISM Code. The MODU and Project support vessels will comply with applicable international and national maritime legal requirements, including COLREGs (Ref. ii) and the display of appropriate lights, shapes and signals.</p> <p>25. Project support vessels shall be scheduled and operationally coordinated by the Project logistics team. The owners and/or operators of the Platform Supply Vessels shall be responsible for ensuring that each vessel displays the applicable lights and marks and operates AIS, where required, and complies with applicable international, Flag-State, and coastal-State requirements, including applicable Greek legislation, COLREGs (Ref. ii) and SOLAS (Ref. x).</p> <p>26. Subject to authorisation by the competent Greek authorities, a 500 m safety zone around the MODU will be established and notified for the duration of well operations. Unauthorised vessel access to the safety zone will be restricted in accordance with the applicable authorisation and maritime notices. The PSVs will assist the MODU in monitoring the safety zone and communicating with approaching vessels, as required, whilst on site.</p> |

Information on the establishment and duration of the safety zone, and relevant details of the operation, shall be disseminated through official maritime-safety information channels, including NAVTEX messages, navigational warnings, and, where applicable, Notices to Mariners, issued or coordinated by the Hellenic Navy Hydrographic Service in cooperation with the competent Hellenic Coast Guard authorities.</p>                                                                                                                                                                                                                                          |
| Cultural heritage        | Protect underwater cultural heritage and ensure appropriate management of chance archaeological discoveries | <p>28. All project activities shall be governed principally by Law 4858/2021 (Code of Legislation for the Protection of Antiquities and Cultural Heritage) and informed by the principles of the UNESCO Convention on the Protection of the Underwater Cultural Heritage (2001) to ensure the appropriate management and, where practicable, in situ preservation of submerged archaeological resources.</p>                                                                                                                                                                                                                                                                |
|                          |                                                                                                             | <p>29. Prior to the commencement of drilling activities, the Company shall submit to the Hellenic Ephorate of Underwater Antiquities the results of the detailed seabed survey of the marine area at the proposed Asopus-1 well location for review with respect to the potential presence of underwater cultural heritage. Based on the results of this review, and if deemed necessary by the Ephorate, an on-site underwater archaeological survey using technology (ROV, SSS, Sub bottom profiler) shall be provided in the marine area where the exploration drilling is planned to take place. The cost of conducting this survey must be covered by the Company.</p> |
|                          |                                                                                                             | <p>30. Any additional geophysical, environmental or engineering datasets acquired before drilling that provide materially relevant new seabed information for areas subject to planned Project disturbance shall be reviewed to determine whether they materially change the archaeological baseline or require further archaeological assessment and/or notification to the Competent Authority.</p>                                                                                                                                                                                                                                                                       |

| ENVIRONMENTAL PARAMETERS | OBJECTIVE OF MEASURE                    | MITIGATION MEASURES DURING DRILLING PREPARATION & MOBILISATION                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------------------|-----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                          |                                         | <p>31. Prior to the commencement of drilling activities, relevant findings and applicable requirements from the archaeological assessment shall be communicated to personnel responsible for planning, supervising or conducting Project activities involving seabed interaction.</p> <p>32. Project personnel engaged in activities involving seabed interaction or subsea observation shall be informed of the applicable cultural heritage controls and made aware of the procedures to follow in the event of a suspected discovery. In the event of a suspected archaeological discovery within the area of the Asopus -1 well location, the relevant Contractor shall implement the actions assigned under the Chance Find Procedure, including stopping any activity under its control that could disturb the suspected find and promptly reporting it through the defined Project reporting route.</p>                                                                                          |
| Economic Activities      | Minimise impacts on economic activities | <p>33. The Project shall actively identify and engage with capable local and other Greek suppliers and service providers for logistics, port services, and other support activities where they meet the Project's safety, operational, and commercial requirements.</p> <p>34. Regular and timely communication shall be maintained with the Hellenic Coast Guard, relevant fisheries organisations, the Port Authorities of Igoumenitsa and Corfu, Corfu International Airport operator, and other identified key stakeholders throughout mobilisation.</p> <p>35. Where practicable, mobilisation logistics at the Port of Igoumenitsa shall be scheduled in coordination with the Port Authority to minimise disruption to routine port commercial and passenger operations.</p> <p>36. Advance notification of the planned drilling campaign and its indicative timing shall be provided to local fishing associations and tourism/port stakeholders to support their own operational planning.</p> |

| ENVIRONMENTAL PARAMETERS | OBJECTIVE OF MEASURE                                                       | MITIGATION MEASURES DURING DRILLING PREPARATION & MOBILISATION                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------------------|----------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Community H&S            | Protect the community health, safety and welfare of workers and the public | 37. Appropriate Personal Protective Equipment (PPE) shall be provided and used by all personnel, where required by the task and work area, in accordance with site procedures at the onshore logistics base and during marine operations. Each Project contractor and company shall be responsible for ensuring its personnel comply with the Project's PPE requirements.                                                                                                                                               |
|                          |                                                                            | 38. Each Project company and contractor shall maintain appropriate training and competence systems for its personnel and shall ensure that personnel have the skills, qualifications and risk awareness necessary to perform the activities assigned to them. Personnel shall receive project-specific briefings on marine operations, traffic management and emergency response, as applicable. Lifting operations shall be carried out by the appropriate contractor with the required competence and qualifications. |
|                          |                                                                            | 39. Emergency response drills, including fire, medical evacuation, man overboard and oil spill response exercises, shall be conducted at intervals defined in the Project and vessel emergency response procedures, and in accordance with applicable legal and Flag-State requirements.                                                                                                                                                                                                                                |
|                          |                                                                            | 40. The Onshore Traffic Management Plan shall be updated by the relevant Contractors, reviewed by Energean and the Port Authority, and used as the basis for the detailed site-specific plan to be implemented prior to mobilisation. The plan shall control vehicle movements, signage and site access.                                                                                                                                                                                                                |
|                          |                                                                            | 41. Mobilisation of the MODU and support vessels shall be coordinated with the competent maritime authorities, including the Hellenic Navy Hydrographic Service and Hellenic Coast Guard, with advance issuance of Notices to Mariners and NAVTEX broadcasts, as applicable, prior to transit and positioning.                                                                                                                                                                                                          |
|                          |                                                                            | 42. Installation of the temporary helicopter hangar and associated helicopter operations at Corfu International Airport shall comply with applicable civil aviation safety procedures and airport operator requirements and shall be coordinated with the relevant airport authorities.                                                                                                                                                                                                                                 |

| ENVIRONMENTAL PARAMETERS | OBJECTIVE OF MEASURE                                                                      | MITIGATION MEASURES DURING DRILLING PREPARATION & MOBILISATION                                                                                                                                                              |
|--------------------------|-------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Technical Infrastructure | Avoid disruption to maritime, energy, telecommunications and environmental infrastructure | 43. Project activities at the Port of Igoumenitsa shall be undertaken in accordance with the applicable Environmental Terms (Ref. No. 139663103448/08/01.06.2009, as amended and in effect at the time of this assessment). |

**Table 2-6: Proposed mitigation measures for potential adverse environmental and social impacts during the drilling operations**

| ENVIRONMENTAL PARAMETERS                    | OBJECTIVE OF MEASURE                                                                | MITIGATION MEASURES DURING DRILLING OPERATIONS                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------------------------------|-------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Climatic and Bioclimatic Characteristics    | Minimise greenhouse gas emissions and air pollutant emissions                       | <b>MM2-1</b> Each Project Contractor shall maintain all machinery, vessels, and vehicles used in the Project according to manufacturer specifications to reduce exhaust emissions. Maintenance shall be carried out by the relevant contractor/owner in accordance with manufacturer schedules, at licensed onshore facilities where practicable.                                                                                                                                                                                              |
|                                             |                                                                                     | <b>MM2-2</b> The MODU and all support vessels shall comply with the requirements of MARPOL 73/78 Convention, Annex VI "Regulations for the Prevention of Air Pollution from Ships". Annex VI regulates emissions of ozone-depleting compounds, nitrogen oxides (NOX), sulfur oxides (SOx) and volatile organic compounds (VOCs).                                                                                                                                                                                                               |
|                                             |                                                                                     | <b>MM2-3</b> Energean shall coordinate with Contractors, the Port Authority and Corfu International Airport to optimise support vessel and helicopter logistics through careful voyage planning, taking into account rig operational requirements, so as to minimise the number of vessel trips, reduce the duration of activities within the project area, and avoid unnecessary engine operation and idling, to the extent achievable within the operational constraints of each party involved.                                             |
| Morphological and Landscape Characteristics | Minimise impacts on landscape characteristics, visual amenity and seabed morphology | <b>MM2-4</b> Use LED lighting for interior lighting, where practicable, and avoid unnecessary operation of external lighting.                                                                                                                                                                                                                                                                                                                                                                                                                  |
|                                             |                                                                                     | <b>MM2-5</b> Onshore Project support activities at the Port of Igoumenitsa and Corfu International Airport shall be undertaken within the areas allocated or agreed for Project use by the relevant facility operator. Project equipment, materials, vehicles and wastes shall be stored, handled and parked only within designated areas, except when being transported in accordance with applicable logistics and waste-management arrangements. Unauthorised disposal or storage outside the designated Project areas shall be prohibited. |
|                                             |                                                                                     | <b>MM2-6</b> The Project shall use the existing surfaced areas of the onshore logistics base, and no additional permanent impermeable surfacing is planned. If additional surfacing is subsequently required for safe Project operations, it shall be limited to the minimum necessary extent within the area allocated for Project use and shall be subject to prior agreement with the Port operator and any applicable approvals. Any reinstatement requirements shall be agreed with the Port operator.                                    |

|                                                          |                                                                           | <b>MM2-7</b> While conducting well operations at the Asopus-1 location, the MODU shall maintain station using a dynamic positioning system meeting IMO DP Equipment Class 3 requirements or an equivalent Class 3 notation accepted by the relevant Flag State and classification society. No anchoring is planned for routine station-keeping.                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Geological, Tectonic and Soil / Sediment Characteristics | Protect soil /sediment and prevent physical disturbance and contamination | <b>MM2-8</b> Hazardous and non-hazardous waste (identified as such under applicable legislation or the relevant Safety Data Sheet) generated offshore shall be segregated, stored, handled and transferred to authorised shore reception or waste-management facilities in accordance with the Project Waste Management Plan and the applicable requirements of MARPOL, the Barcelona Convention and its Offshore Protocol, and EU and Greek legislation. No solid or hazardous waste shall be intentionally discharged to the marine environment. Operational discharges, including drilling fluids and cuttings, sewage, bilge water, ballast water and food waste, shall be managed in accordance with the relevant discharge-specific measures and applicable legal requirements. |
|                                                          |                                                                           | <b>MM2-9</b> Fuel, chemicals and hazardous materials (identified as such under applicable legislation or the relevant Safety Data Sheet) stored at the onshore logistics base shall be kept in designated areas with secondary containment and segregation appropriate to the nature, quantity and spill risk of the materials. Suitable spill response materials and equipment shall be readily available at relevant storage, transfer and handling locations, in accordance with applicable site procedures and Project spill-response arrangements.                                                                                                                                                                                                                               |
|                                                          |                                                                           | <b>MM2-10</b> Drilling fluids, cuttings and chemicals shall be managed in accordance with the Project Chemical Use Plan, Waste Management Plan, assessed discharge arrangements and applicable regulatory requirements. Water-based muds will be used, with no planned use of oil-based or non-aqueous drilling fluids. Preference is given to PLONOR substances, CHARM Gold products or OCNS Group E products, as applicable, where operationally suitable and available. Other chemicals may be used where required for planned or contingency operations, provided their suitability has been reviewed, and no suitable lower-hazard alternative is reasonably available.                                                                                                          |
|                                                          |                                                                           | <b>MM2-11</b> Cementing discharges shall be managed according to the Chemical Use Plan, assessed discharge arrangements, applicable regulatory requirements and, where relevant, the Waste Management Plan. Preference is given to cementing chemicals comprising PLONOR substances or classified as CHARM Gold or OCNS Group E, as applicable, where operationally suitable and available. Other chemicals may be used where required for planned or contingency cementing operations, provided their suitability has been reviewed, and no suitable lower-hazard alternative is reasonably available.                                                                                                                                                                               |
| Air quality                                              | Protect ambient air quality by minimising atmospheric emissions           | <b>MM2-12</b> Drilling activities shall be planned and managed by the Drilling Contractor to minimise unnecessary engine operation, idling and associated atmospheric emissions.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Noise and Vibrations                                     | Minimise underwater and airborne noise and protect marine fauna           | <b>MM2-13</b> Material handling and cargo operations at the logistics base shall be undertaken by the relevant Contractors in accordance with applicable Port of Igoumenitsa operating procedures, using equipment maintained in good working order to minimise unnecessary noise emissions.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| ENVIRONMENTAL PARAMETERS | OBJECTIVE OF MEASURE     | MITIGATION MEASURES DURING DRILLING OPERATIONS                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------------|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Seawater                 | Protect seawater quality | <b>MM2-14</b> Routine inspection and maintenance of the drillship, support vessels, helicopters, generators and relevant noise-generating mechanical equipment shall be undertaken in accordance with applicable maintenance programmes and manufacturers' recommendations, minimising unnecessary noise and vibration emissions.                                                                                                                                                                                                                                                                                                             |
|                          |                          | <b>MM2-15</b> Support vessel operations shall be coordinated by Energean, in collaboration with the relevant Contractors, taking account of the facility operator, vessel and rig operational and safety requirements, to minimise underwater noise and unnecessary engine operation and idling, where reasonably practicable.                                                                                                                                                                                                                                                                                                                |
|                          |                          | <b>MM2-16</b> All Vertical Seismic Profiling (VSP) operations shall commence with a soft start (ramp-up), gradually increasing acoustic energy from low to full operational power over 20–30 minutes, in accordance with the Marine Mammal Mitigation Plan. The duration of VSP operations shall be limited to that reasonably necessary to achieve the survey objectives.                                                                                                                                                                                                                                                                    |
|                          |                          | <b>MM2-17</b> Offshore-generated hazardous and non-hazardous wastes shall be managed in accordance with the Waste Management Plan and applicable requirements of MARPOL, the Barcelona Convention and its Offshore Protocol, and EU and Greek legislation. Operational discharges shall be managed in accordance with the requirements applicable to each discharge stream, including MARPOL, the BWM Convention, the Barcelona Convention and its Offshore Protocol, and EU and Greek legislation, as relevant. Chemical selection, use and discharge shall be controlled through the Chemical Use Plan.                                     |
|                          |                          | <b>MM2-18</b> A Chemical Use Plan shall be implemented, which shall include: (i) the chemicals proposed for planned and contingency operations and relevant environmental hazard and ecotoxicity information; (ii) the purpose or purposes for which the chemicals are intended to be used; (iii) the estimated concentrations and quantities of the chemicals intended to be used; (iv) the potential routes and locations through which chemicals may be discharged to the marine environment, as applicable. Chemical selection shall take account of operational requirements and the availability of suitable lower-hazard alternatives. |
|                          |                          | <b>MM2-19</b> Only chemicals required for drilling, cementing and associated well operations, together with chemicals required for routine vessel and equipment operations, will be used offshore. No well-completion, stimulation or production-related chemicals are planned.                                                                                                                                                                                                                                                                                                                                                               |
|                          |                          | <b>MM2-20</b> Chemical selection will follow the principles of avoid, substitute, minimise and control to reduce potential risks to seawater quality. Preference will be given to PLONOR substances and CHARM Gold or OCNS Group E products, as applicable, where operationally suitable and reasonably available. Other chemicals may be selected where required for planned or contingency operations following review of their suitability and available lower-hazard alternatives.                                                                                                                                                        |
|                          |                          | <b>MM2-21</b> The use and discharge of substances covered by Annex I of the Offshore Protocol shall be prohibited, except where permitted under the applicable regulatory framework. Chemicals with higher-hazard classifications will be used only where required for a specific technical function and where no suitable lower-hazard alternative is reasonably available.                                                                                                                                                                                                                                                                  |

| ENVIRONMENTAL PARAMETERS | OBJECTIVE OF MEASURE | MITIGATION MEASURES DURING DRILLING OPERATIONS                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

|                          |                      | <b>MM2-22</b> Pipe dope and casing dope will be treated as non-discharged chemicals, with application controlled to minimise excess material and prevent planned discharge to sea.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|                          |                      | <b>MM2-23</b> Chemical transfer, storage and handling offshore will be controlled through containment, spill prevention, bunding, or closed drainage where applicable, trained personnel and inventory management, taking account of the nature, quantity and spill risk of the chemicals.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|                          |                      | <b>MM2-24</b> Drilling cuttings and water-based drilling fluids discharged at the seabed during the riserless sections shall be managed in accordance with applicable regulatory requirements, including the Barcelona Convention Offshore Protocol and the relevant UNEP/MAP Common Standards and Guidelines for the use and disposal of drilling fluids and cuttings in the Mediterranean.                                                                                                                                                                                                                                                                                                                                                                                                                                |
|                          |                      | <b>MM2-25</b> Drilling cuttings and associated drilling fluids generated after installing the riser shall be managed in accordance with applicable regulatory requirements, including the Barcelona Convention Offshore Protocol and the relevant UNEP/MAP Common Standards and Guidelines for the use and disposal of drilling fluids and cuttings in the Mediterranean. Drilling returns shall be monitored through LWD, mudlogging and routine observation. Where cuttings or drilling returns are identified as mixed with reservoir hydrocarbons in concentrations that make them unsuitable for discharge under applicable requirements, discharge of the affected material shall cease. The affected cuttings and fluids shall be contained onboard and transferred ashore for management at an authorised facility. |
|                          |                      | <b>MM2-26</b> Sanitary wastewater (blackwater and greywater) shall be managed and discharged in accordance with the requirements of MARPOL Annex IV and applicable Greek legislation. Blackwater shall be treated in an approved sewage treatment system prior to discharge. Where applicable discharge requirements cannot be achieved, sewage shall be retained in holding tanks and either discharged once the requirements can be met or transferred to authorised shore reception facilities.                                                                                                                                                                                                                                                                                                                          |
|                          |                      | <b>MM2-27</b> Bilge water collected from machinery spaces shall be routed to dedicated bilge holding tanks and processed through an approved oily water separator (OWS) equipped with a certified oil content monitor and automatic stopping device. Treated bilge water may only be discharged when the oil content of the undiluted effluent does not exceed 15 mg/L (15 ppm) and all other applicable MARPOL Annex I discharge conditions are met.                                                                                                                                                                                                                                                                                                                                                                       |
|                          |                      | <b>MM2-28</b> Deck drainage from non-hazardous areas shall be discharged through the vessel drainage system. Any tainted runoff shall be contained and managed through the vessel's applicable drainage and treatment arrangements, including the oily water separator (OWS), if applicable. Where oily drainage is treated through an OWS, the oil content of any discharge shall not exceed 15 mg/L (15 ppm). Deck drainage may only be discharged to sea where permitted under applicable MARPOL, Flag State and vessel requirements and where no visible oil sheen would result.                                                                                                                                                                                                                                        |

| ENVIRONMENTAL PARAMETERS                    | OBJECTIVE OF MEASURE                                                              | MITIGATION MEASURES DURING DRILLING OPERATIONS                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

Any accidental spills will be managed in accordance with the Project spill response procedures. Use of pipe dope shall be subject to the Chemical Use Plan, and pipe dope shall not be intentionally discharged to seawater.                                                                                                                                                                                                             |
|                                             |                                                                                   | <b>MM2-32</b> Brine streams may only be discharged where they do not contain oil or harmful substances and in accordance with applicable MARPOL requirements, Greek environmental legislation, permit conditions and vessel procedures.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|                                             |                                                                                   | <b>MM2-33</b> Food waste shall be comminuted or ground to pass through a screen with openings no greater than 25 mm and may only be discharged in accordance with the location and operational conditions applicable to the MODU and Project vessels under MARPOL Annex V, including the applicable minimum distance from the nearest land. Food waste mixed with other waste shall not be discharged.                                                                                                                                                                                                                                                                                                                                                                     |
| Flora, fauna, habitats, and protected areas | Protect marine fauna, and protected species by avoiding or minimising disturbance | <b>MM2-34</b> Before commencing VSP operations, certified Marine Mammal Observers (MMOs) shall conduct a pre-shooting visual search for marine mammals and sea turtles within the 500 m zone specified in the Marine Mammal Mitigation Plan. Passive Acoustic Monitoring (PAM) shall supplement visual monitoring for vocalising marine mammals during darkness or poor visibility. The duration of the pre-shooting search, ramp-up (soft-start) procedure, and the delay, shutdown and restart criteria shall be implemented in accordance with the Marine Mammal Mitigation Plan and applicable regulatory requirements.                                                                                                                                                |
|                                             |                                                                                   | <b>MM2-35</b> During VSP operations, two Marine Mammal Observers (MMOs), holding ACCOBAMS certification or an equivalent recognised qualification, shall be deployed at suitable observation points onboard the vessel to provide effective visual coverage of the 500 m mitigation zone. One or more suitably qualified PAM operators shall be provided, as required by the Marine Mammal Mitigation Plan, to implement monitoring during darkness or poor visibility. Marine mammal and sea turtle sightings, pre-shooting searches, delays, soft-starts, shutdowns and other mitigation actions shall be recorded using the applicable reporting forms and submitted in accordance with the Marine Mammal Mitigation Plan and applicable permit/reporting requirements. |

| ENVIRONMENTAL PARAMETERS | OBJECTIVE OF MEASURE | MITIGATION MEASURES DURING DRILLING OPERATIONS                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------------------|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                          |                      | <b>MM2-36</b> All acoustic source tests shall commence with a soft-start (ramp-up), gradually increasing acoustic energy from low to full operational power over 20–30 minutes, in accordance with the Marine Mammal Mitigation Plan. If a marine mammal or sea turtle is detected within the 500 m zone before full power is reached, acoustic operations shall be suspended and shall not recommence until the applicable clearance, and restart requirements have been met. |
|                          |                      | <b>MM2-37</b> If marine mammals or sea turtles are detected within the 500 m mitigation zone, acoustic operations shall be delayed until the animals have left the area and at least 20 minutes have elapsed since the last visual sighting, or for any longer period specified in the Marine Mammal Mitigation Plan.                                                                                                                                                          |
|                          |                      | <b>MM2-38</b> In the event of a collision between a Project vessel and a marine mammal or sea turtle, the vessel's Master shall immediately report the incident to Energean in accordance with the Project's incident-reporting procedure. Energean shall, as soon as reasonably practicable and within any applicable regulatory timeframe, formally notify the competent environmental and other relevant authorities, as required by applicable legislation.                |
|                          |                      | <b>MM2-39</b> Project-related vessels shall operate at speeds not exceeding 14 knots, or their maximum operational speed where lower, within areas identified in the Marine Mammal Mitigation Plan as having higher marine mammal presence, without compromising vessel safety or emergency response capability.                                                                                                                                                               |
|                          |                      | <b>MM2-40</b> Vessels shall maintain a safe distance from any observed marine mammal, avoid approaching it head-on, avoid crossing or waiting ahead of its direction of travel, and, where safe and practicable, steer behind its path.                                                                                                                                                                                                                                        |
|                          |                      | <b>MM2-41</b> No planned discharge from the MODU or Project vessels shall be made if at any point a vessel is within the Ionian Archipelago IMMA or the Nisoi Paxoi Kai Antipaxoi Kai Evryteri Thalassia Periochi (GR2230003) Natura 2000 site.                                                                                                                                                                                                                                |
|                          |                      | <b>MM2-42</b> Appropriate screens or equivalent protective measures shall be fitted to the drillship seawater intakes to minimise the risk of entrainment of marine flora and fauna.                                                                                                                                                                                                                                                                                           |
|                          |                      | <b>MM2-43</b> Light emissions shall be minimised during night-time hours, as far as practicable while maintaining safe operations and navigational requirements. Directional lighting shall be used, where practicable, to minimise light spill onto the sea.                                                                                                                                                                                                                  |
|                          |                      | <b>MM2-44</b> External lighting shall comply with applicable maritime, aviation, Flag State and operational safety requirements. Where practicable without affecting those requirements, non-essential lighting shall be positioned, directed or shielded to minimise unnecessary upward and outward light spill, particularly during bird-migration periods.                                                                                                                  |
|                          |                      | <b>MM2-45</b> Where fitted, blinds or other available screening shall be used on accommodation windows during hours of darkness, where practicable, to minimise unnecessary outward light spill, particularly during bird-migration periods.                                                                                                                                                                                                                                   |

| ENVIRONMENTAL PARAMETERS | OBJECTIVE OF MEASURE              | MITIGATION MEASURES DURING DRILLING OPERATIONS                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------------------------|-----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                          |                                   | <b>MM2-46</b> Helicopter flights shall be planned and conducted by the helicopter operator in accordance with applicable aviation requirements, air-traffic-control instructions and Corfu International Airport operator procedures. Where safe and operationally practicable, flight routes and altitudes shall be selected to avoid unnecessary overflight of known bird breeding, roosting or concentration areas identified as relevant to the Project.                                                                                                                                           |
| Maritime uses            | Minimise impacts on maritime uses | <b>MM2-47</b> The OIM/Master of the MODU and the Master of each support vessel shall have overriding authority and responsibility to make decisions with respect to safety and pollution prevention, in accordance with the ISM Code. The MODU and Project support vessels will comply with applicable international and national maritime legal requirements, including COLREGs (Ref. ii) and the display of appropriate lights, shapes and signals.                                                                                                                                                  |
|                          |                                   | <b>MM2-48</b> The main operators of cruise ships and LNG carriers identified through the Shipping and Navigation Assessment as regularly passing within or near 500 m of the site shall be provided with advance notice of the Asopus-1 operations. This notice shall supplement applicable official navigational notifications, including NAVTEX messages and Notices to Mariners, enabling the vessel operators to review or amend their passage plans, if required.                                                                                                                                 |
|                          |                                   | <b>MM2-49</b> The MODU will have a vessel-specific collision risk management plan, informed by the site-specific Shipping and Navigation Assessment, to reduce the risk of collision from third-party vessels while it is restricted in its ability to manoeuvre (RAM) and engaged in well operations. The plan shall include measures to provide adequate warning time, continuous monitoring of marine traffic by competent watchkeepers using AIS, ARPA and other available navigational aids, and appropriate communications, lights, shapes and signals reflecting the MODU's operational status. |
|                          |                                   | <b>MM2-50</b> Project support vessels shall be scheduled and operationally coordinated by the Project logistics team. The owners and/or operators of the Platform Supply Vessels shall be responsible for ensuring that each vessel displays the applicable lights and marks and operates AIS, where required, and complies with applicable international, Flag-State, and coastal-State requirements, including applicable Greek legislation, COLREGs (Ref. ii) and SOLAS (Ref. x).                                                                                                                   |
|                          |                                   | <b>MM2-51</b> Subject to authorisation by the competent Greek authorities, a 500 m safety zone around the MODU will be established and notified for the duration of well operations. Unauthorised vessel access to the safety zone will be restricted in accordance with the applicable authorisation and maritime notices. The PSVs will assist the MODU in monitoring the safety zone and communicating with approaching vessels, as required, whilst on site.                                                                                                                                       |
|                          |                                   | <b>MM2-52</b> Information on the establishment and duration of the safety zone, and relevant details of the operation, shall be disseminated through official maritime-safety information channels, including NAVTEX messages, navigational warnings, and, where applicable, Notices to Mariners, issued or coordinated by the Hellenic Navy Hydrographic Service in cooperation with the competent Hellenic Coast Guard authorities.                                                                                                                                                                  |

|--------------------------|-------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                          |                                                                                                             | <p><b>MM2-53</b> The drillship will have an Emergency Response Plan detailing procedures to be followed in an emergency. The MODU shall also maintain Well-Specific Operating Guidelines (WSOG), informed by the applicable station-keeping, riser and emergency-disconnect analyses, defining the operating limits, alert status and actions for loss or degradation of position. Where required by the WSOG and associated MODU procedures, the Emergency Disconnect Sequence (EDS) shall be initiated to secure the well and enable the MODU to disengage safely.</p> <p><b>MM2-54</b> The Operator will maintain appropriate liaison with relevant fishing associations during drilling operations to communicate material changes or issues that may affect fishing activities and, where reasonably practicable, minimise interference with fishing vessels.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Cultural heritage        | Protect underwater cultural heritage and ensure appropriate management of chance archaeological discoveries | <p><b>MM2-55</b> During drilling operations, personnel engaged in seabed interaction or subsea observation shall remain aware of the applicable cultural heritage controls. If suspected archaeological material is identified, any activity under their control that could disturb the suspected find shall be stopped, and the discovery shall be promptly reported and managed in accordance with the Project Chance Find Procedure.</p> <p><b>MM2-56</b> No archaeological remains were identified within the immediate project footprint. However, should material of possible archaeological significance be encountered during project activities, the following Chance Find Procedure shall be implemented: • The affected activity shall be stopped to the extent necessary to avoid disturbance. • Record the location and nature of the find and apply practicable controls to avoid further disturbance. • Obtain photographic and/or video documentation of the discovery where practicable. • Inform the OIM/Master and the designated Project representative through the defined Project reporting route. • Obtain advice from an appropriately qualified maritime archaeologist where required to support notification, preliminary interpretation or the response requested by the competent authority. • The designated Project representative shall notify the Ephorate of Underwater Antiquities within the timeframe required by applicable law, permit conditions or agreed notification arrangements, providing the available relevant information. • The suspended seabed-disturbing activity shall not recommence within the affected area until authorised by the Project Operator, taking into account the OIM/Master's independent authority and any direction received from the competent authority.</p> <p><b>MM2-57</b> The Cultural Heritage Management Plan should be reviewed and updated where necessary if: • New archaeological discoveries are made; • Additional geophysical or seabed investigations provide new, material information relevant to the cultural heritage assessment or the planned disturbance footprint; • Project activities are modified in a manner that may affect cultural heritage resources; • New information becomes available regarding the archaeological potential of the project area.</p> |
| Economic Activities      | Minimise impacts on economic activities                                                                     | <p><b>MM2-58</b> The Project shall actively identify and engage with capable local and other Greek suppliers and service providers for logistics, port services, and other support activities where they meet the Project's safety, operational, and commercial requirements.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| ENVIRONMENTAL PARAMETERS | OBJECTIVE OF MEASURE                                                       | MITIGATION MEASURES DURING DRILLING OPERATIONS                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

|                          |                                                                            | <b>MM2-61</b> Relevant local stakeholders shall be provided with an appropriate contact route in the Energean website for raising Project-related concerns during drilling operations. Concerns received shall be recorded and addressed in accordance with applicable Project procedures.                                                                                                                                                                                                                                        |
|                          |                                                                            | <b>MM2-62</b> Where practicable, mobilisation logistics at the Port of Igoumenitsa shall be scheduled in coordination with the Port Authority to minimise disruption to routine port commercial and passenger operations.                                                                                                                                                                                                                                                                                                         |
| Community H&S            | Protect the community health, safety and welfare of workers and the public | <b>MM2-63</b> Appropriate Personal Protective Equipment (PPE) shall be provided and used by all personnel, where required by the task and work area, in accordance with site procedures at the onshore logistics base and during marine operations. Each Project contractor and company shall be responsible for ensuring its personnel comply with the Project's PPE requirements.                                                                                                                                               |
|                          |                                                                            | <b>MM2-64</b> Each Project company and contractor shall maintain appropriate training and competence systems for its personnel and shall ensure that personnel have the skills, qualifications and risk awareness necessary to perform the activities assigned to them. Personnel shall receive project-specific briefings on marine operations, traffic management and emergency response, as applicable. Lifting operations shall be carried out by the appropriate contractor with the required competence and qualifications. |
|                          |                                                                            | <b>MM2-65</b> Emergency response drills, including fire, medical evacuation, man overboard and oil spill response exercises, shall be conducted at intervals defined in the Project and vessel emergency response procedures, and in accordance with applicable legal and Flag-State requirements.                                                                                                                                                                                                                                |
|                          |                                                                            | <b>MM2-66</b> Subject to authorisation by the competent Greek authorities, the 500 m safety zone around the MODU shall be maintained during well operations and notified through applicable official maritime-safety information channels. The MODU shall maintain continuous watchkeeping using AIS, ARPA, VHF and other available navigational aids, consistent with the Shipping and Navigation Assessment.                                                                                                                    |
|                          |                                                                            | <b>MM2-67</b> Sealed radioactive sources may be used only where required for formation-evaluation tools within specific well-logging or logging-while-drilling tools. Their use, storage and transport shall be managed by the relevant licensed contractor in accordance with applicable EEAE authorisations, Greek radiation-protection requirements and the contractor's approved radiation-safety procedures.                                                                                                                 |
|                          |                                                                            | <b>MM2-68</b> Chemical handling shall follow the Chemical Use Plan and applicable contractor procedures, including review of relevant Safety Data Sheets, appropriate containment and segregation, and spill-prevention and response arrangements at the shore base and offshore.                                                                                                                                                                                                                                                 |

| ENVIRONMENTAL PARAMETERS                | OBJECTIVE OF MEASURE                                                                      | MITIGATION MEASURES DURING DRILLING OPERATIONS                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------------------------------|-------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                         |                                                                                           | <b>MM2-69</b> Helicopter transfers between Corfu International Airport and the MODU shall be conducted by the helicopter operator in accordance with applicable aviation requirements and the requirements and procedures of the Corfu International Airport operator, taking account of operational, air traffic and weather conditions, to minimise risks to third parties.                                                                                                                                                          |
| Technical Infrastructure                | Avoid disruption to maritime, energy, telecommunications and environmental infrastructure | <b>MM2-70</b> Project activities at the Port of Igoumenitsa shall be undertaken in accordance with the applicable Environmental Terms (Ref. No. 139663103448/08/01.06.2009, as amended and in effect at the time of this assessment).                                                                                                                                                                                                                                                                                                  |
| Environmental Management and Monitoring | Ensure environmental compliance and verification of mitigation measures                   | <b>MM2-71</b> An Environmental Monitoring Programme (EMP) shall be implemented throughout the Project to verify compliance with applicable environmental requirements and monitor the effectiveness of mitigation measures. Monitoring shall include, as appropriate, drilling discharges, seawater quality, waste management, chemical use, environmental incidents and marine fauna observations. Monitoring results shall be reviewed in accordance with the EMP, and proportionate corrective actions implemented where necessary. |

**Table 2-7: Mitigation measures for potential adverse environmental and social impacts during the decommissioning and site restoration phase of the project**

| ENVIRONMENTAL PARAMETERS                    | OBJECTIVE OF MEASURE                                                                       | MITIGATION MEASURES DURING DECOMMISSIONING & SITE RESTORATION                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------------------------------------|--------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Climatic and Bioclimatic Characteristics    | Minimise greenhouse gas emissions and atmospheric pollutants                               | <b>MM3-1</b> Each Project Contractor shall maintain all machinery, vessels, and vehicles used in the Project according to manufacturer specifications to reduce exhaust emissions. Maintenance shall be carried out by the relevant contractor/owner in accordance with manufacturer schedules, at licensed onshore facilities where practicable.                                                                                                                                                           |
|                                             |                                                                                            | <b>MM3-2</b> The MODU and all support vessels shall comply with the requirements of MARPOL 73/78 Convention, Annex VI "Regulations for the Prevention of Air Pollution from Ships". Annex VI regulates emissions of ozone-depleting compounds, nitrogen oxides (NOX), sulfur oxides (SOx) and volatile organic compounds (VOCs).                                                                                                                                                                            |
|                                             |                                                                                            | <b>MM3-3</b> Energean shall coordinate with relevant Contractors, the Port Authority and Corfu International Airport to optimise support vessel and helicopter logistics through careful voyage planning, taking into account rig operational requirements, so as to minimise the number of vessel trips, reduce the duration of activities within the project area, and avoid unnecessary engine operation and idling, to the extent achievable within the operational constraints of each party involved. |
| Morphological and Landscape Characteristics | Restore the project area and prevent permanent alteration of seabed and onshore facilities | <b>MM3-4</b> Upon completion of drilling and Plug and Abandonment (P&A), temporary subsea equipment deployed by the Project shall be recovered. An ROV seabed survey shall be undertaken within a 50 m radius of the well location to identify Project-related debris. Temporary Project equipment and materials shall be removed from the onshore support facilities or otherwise managed in accordance with arrangements agreed with the relevant facility operator.                                      |
|                                             |                                                                                            | <b>MM3-5</b> Any temporary areas used for Project activities at the onshore logistics base shall be left in the condition agreed with the relevant facility operator following completion of Project use.                                                                                                                                                                                                                                                                                                   |

This notice shall supplement applicable official navigational notifications, including NAVTEX messages and Notices to Mariners, enabling the vessel operators to review or amend their passage plans, if required.                                                                                                                                                                                                                                                                                                                 |
|                                                          |                                                                        | <b>MM3-17</b> The OIM/Master of the MODU and the Master of each support vessel shall have overriding authority and responsibility to make decisions with respect to safety and pollution prevention, in accordance with the ISM Code. The MODU and Project support vessels will comply with applicable international and national maritime legal requirements, including COLREGs (Ref. ii) and the display of appropriate lights, shapes and signals.                                                                                                                                                                                                                                                                                                                                  |

| ENVIRONMENTAL PARAMETERS | OBJECTIVE OF MEASURE                                                                                        | MITIGATION MEASURES DURING DECOMMISSIONING & SITE RESTORATION                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------------|-------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                          |                                                                                                             | <p><b>MM3-18</b> Project support vessels shall be scheduled and operationally coordinated by the Project logistics team. The owners and/or operators of the Platform Supply Vessels shall be responsible for ensuring that each vessel displays the applicable lights and marks and operates AIS, where required, and complies with applicable international, Flag-State, and coastal-State requirements, including applicable Greek legislation, COLREGs (Ref. ii) and SOLAS (Ref. x).</p> <p><b>MM3-19</b> Subject to authorisation by the competent Greek authorities, a 500 m safety zone around the MODU will be established and notified for the duration of well operations. Unauthorised vessel access to the safety zone will be restricted in accordance with the applicable authorisation and maritime notices. The PSVs will assist the MODU in monitoring the safety zone and communicating with approaching vessels, as required, whilst on site.</p> <p><b>MM3-20</b> Information on the establishment and duration of the safety zone, and relevant details of the operation, shall be disseminated through official maritime-safety information channels, including NAVTEX messages, navigational warnings, and, where applicable, Notices to Mariners, issued or coordinated by the Hellenic Navy Hydrographic Service in cooperation with the competent Hellenic Coast Guard authorities.</p>                                                                                                                |
| Cultural Heritage        | Protect underwater cultural heritage and ensure appropriate management of chance archaeological discoveries | <p><b>MM3-21</b> No archaeological remains were identified within the immediate project footprint. However, should material of possible archaeological significance be encountered during project activities, the Chance Find Procedure shall be implemented.</p> <p><b>MM3-22</b> Any discoveries of potential archaeological significance shall be documented in accordance with the Chance Find Procedure and reported to the competent cultural heritage authorities. Consultation with the Ephorate of Underwater Antiquities shall be undertaken as required regarding any further assessment or protective measures.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Economic Activities      | Minimise impacts on economic activities                                                                     | <p><b>MM3-23</b> The Project shall actively identify and engage with capable local and other Greek suppliers and service providers for logistics, port services, and other support activities where they meet the Project's safety, operational, and commercial requirements.</p> <p><b>MM3-24</b> Regular and timely communication shall be maintained, as required, with the Hellenic Coast Guard, relevant fisheries organisations, the Port Authorities of Igoumenitsa and Corfu, the Corfu International Airport operator and other identified key stakeholders throughout demobilisation, including notification of rig departure and cessation of the Project activities for which the safety zone was established.</p> <p><b>MM3-25</b> Temporary Project facilities and equipment at the Port of Igoumenitsa and Corfu International Airport shall, following completion of Project use, be removed, retained or otherwise managed in accordance with arrangements agreed with the relevant facility operator.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Community H&S            | Protect the community health, safety and welfare of workers and the public                                  | <p><b>MM3-26</b> Appropriate Personal Protective Equipment (PPE) shall be provided and used by all personnel, where required by the task and work area, in accordance with site procedures at the onshore logistics base and during marine operations. Each Project contractor and company shall be responsible for ensuring its personnel comply with the Project's PPE requirements.</p> <p><b>MM3-27</b> Each Project company and contractor shall maintain appropriate training and competence systems for its personnel and shall ensure that personnel have the skills, qualifications and risk awareness necessary to perform the activities assigned to them. Personnel shall receive project-specific briefings on marine operations, traffic management and emergency response, as applicable. Lifting operations shall be carried out by the appropriate contractor with the required competence and qualifications.</p> <p><b>MM3-28</b> Emergency response drills, including fire, medical evacuation, man overboard and oil spill response exercises, shall be conducted at intervals defined in the Project and vessel emergency response procedures, and in accordance with applicable legal and Flag-State requirements.</p> <p><b>MM3-29</b> Waste contractor collections and any removal or dismantling of temporary Project facilities and equipment shall be scheduled and coordinated with the relevant port and airport facility operators to minimise disruption and risks to other facility users.</p> |

| ENVIRONMENTAL PARAMETERS                | OBJECTIVE OF MEASURE                                                                        | MITIGATION MEASURES DURING DECOMMISSIONING & SITE RESTORATION                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------------------------------------|---------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Technical Infrastructure                | Avoid disruption to existing infrastructure and navigation routes during project activities | <b>MM3-30</b> Decommissioning and demobilisation activities shall be planned and coordinated with the relevant port and airport facility operators. Activity timing and arrangements shall, where reasonably practicable, be adjusted to minimise disruption to other facility users, without compromising safety, emergency-response, asset integrity or operational requirements.                                                                                                                                                     |
| Environmental Management and Monitoring | Ensure environmental compliance and verification of mitigation measures                     | <b>MM3-31</b> An Environmental Monitoring Programme (EMP) shall be implemented throughout the Project to verify compliance with applicable environmental requirements and the effectiveness of mitigation measures. Monitoring shall include, as appropriate, drilling discharges, seawater quality, waste management, chemical use, environmental incidents and marine fauna observations. Monitoring results shall be reviewed in accordance with the EMP, and proportionate corrective actions shall be implemented where necessary. |

**Table 2-8: Contingency activities and measures**

| HAZARDS                                                | CONTINGENCY MEASURES                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Inability to continue the original wellbore            | Re-spudding may be necessary if issues arise that make it impractical to continue drilling the current well. Additional cuttings and drilling-fluid discharges may be generated, and additional cement may be required, depending on the stage at which the re-spud is undertaken.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Inability to continue the existing wellbore trajectory | A sidetrack may be required where technical, geological or wellbore conditions make it impractical to continue along the existing wellbore trajectory. The relevant section of the original wellbore shall be isolated, where required, using an appropriate barrier or mechanical system in accordance with the approved well programme and applicable well-integrity requirements. Any sidetrack shall be subject to the applicable management-of-change procedures and any regulatory notification, acceptance or environmental-permitting requirements arising from the proposed change. Any re-spud shall be managed within the assessed Project design envelope or through the applicable management-of-change and regulatory processes.                                        |
| Loss or degradation of MODU station-keeping            | Temporary interruption of operations may be required during the drilling campaign due to adverse weather, equipment issues, or other operational circumstances. Where disconnection from the well is required, the well will be secured using the applicable well barriers and disconnect procedures before the MODU moves off location. Operations may resume once conditions allow and the applicable operational and regulatory requirements have been satisfied.                                                                                                                                                                                                                                                                                                                  |
| Emergency disconnection from the well                  | A contingent Emergency Disconnect Sequence (EDS) may be initiated in the unlikely event the MODU needs to rapidly disengage from the well (e.g., due to severe weather). The EDS is designed to secure the well through the applicable BOP functions before disconnection of the lower marine riser package. Activation may result in the release of a limited quantity of riser contents, including drilling fluid and entrained cuttings, to the marine environment.                                                                                                                                                                                                                                                                                                                |
| Well influx / kick                                     | Managed in accordance with the project well-control bridging document. Response actions may include shutting in the well, monitoring well pressures, and circulating the influx from the wellbore while maintaining control with the applicable well-control equipment.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Well Barrier failure / degradation                     | Well-barrier failure or degradation shall be managed in accordance with the Project Well Control Bridging Document and applicable well-integrity procedures. The well shall be placed in a safe condition, and remedial operations shall be undertaken as required to restore or replace the affected barrier before dependent operations resume.                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Stuck pipe requiring mechanical severance              | Explosives or other cutting tools may be maintained onboard in limited quantities as a contingency measure for mechanical pipe severance (for example in stuck-pipe scenarios). No Tubing-Conveyed Perforating (TCP) or other reservoir-targeting explosive operations are planned for the Asopus-1 campaign. The types and quantities of cutting tools held onboard, and their storage, handling, and use, will be controlled in accordance with applicable legal requirements, vessel procedures, and specialist-vendor arrangements. Tool components and severed tubulars will be recovered where safe and operationally practicable. Any material that cannot be recovered shall be documented and managed in accordance with applicable operational and regulatory requirements. |

Table 2-9: Proposed major accident / hazards prevention measures

| HAZARD                               | MAJOR ACCIDENT / HAZARDS PREVENTION MEASURES                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Blowout and Well Releases            | <ul style="list-style-type: none"> <li>Well control shall be managed through primary, secondary and, where required, tertiary well-control measures in accordance with the approved well programme, the Project Well Control Bridging Document and applicable well-control procedures. Primary well control shall be maintained using the drilling-fluid system and, where applicable, other approved pressure-control techniques. Secondary well control shall use the BOP and associated equipment to shut in and control the well following a loss of primary well control. Where primary and secondary measures are insufficient, appropriate tertiary well-control techniques shall be selected and implemented according to the circumstances.</li> <li>A pre-positioned Emergency Shut-In Device (E-SID), installed between the wellhead and the MODU BOP, will provide an additional independent emergency well-isolation capability. The device can shear and seal on any tubular or cable that may be run inside the well. In the unlikely scenario that the BOP stack fails to shut in a well if required, the E-SID will be activated, and the well will be secured.</li> </ul> <p>The selected MODU shall be equipped with well-control, monitoring, detection, shutdown and emergency systems appropriate to the well and operational hazards and compliant with applicable Flag State, classification, regulatory and Project assurance requirements. Rig-specific arrangements shall be verified through MODU selection, well examination, contractor assurance and the Notification of Well Operations.</p> <p>Source-control arrangements proportionate to the assessed well-release scenarios shall be established for the campaign. These shall address, as applicable, BOP intervention, subsea capping, containment (if applicable) and relief-well planning, in accordance with the Project emergency-response arrangements and applicable regulatory requirements.</p>                                                                                                                                                                                                                                                                                                                                                                                                    |
| Fires, Explosions and Toxic Releases | <p>Mud process areas (shale-shaker, mud pits and mud pump rooms) are designated as Zone 1 (a zone in which an explosive atmosphere is likely to occur during normal operation) hazardous areas and shall be protected by mechanically forced negative-pressure ventilation. Flammable gas detectors shall be installed to detect the presence of flammable gas. Low-expansion foam shall be provided for firefighting in the mud process area, and an A60-rated fire wall shall be provided around the boundaries of the shaker room. The shaker-room entrance door shall be located in an unclassified area (cement unit), while CCTV shall be installed in the shale shaker room to facilitate monitoring of the shaker room.</p> <p>The main engine rooms shall be protected by gas, smoke and flame detection, a fire alarm push-button, a fixed CO<sub>2</sub> extinguishing system, portable firefighting equipment and fire hose stations. The bulkheads separating the engine rooms shall be A-60-rated. Fuel-oil cut-off valves shall be available and shall be remotely operated from outside the main engine room. Two detectors shall be provided at each air intake. The engine room ventilation shall shut down automatically when gas is detected in the engine room air intake. Protection against gas ingress through the combustion air shall be provided by rig savers.</p> <p>The vessel shall be equipped with enclosed escape tunnels on the port and starboard sides leading from aft to the accommodation block. HVAC systems comprising supply and exhaust dampers shall be installed at the aft and forward port and starboard positions of the escape tunnels to provide the needed pressurisation to prevent the ingress of smoke and gas into the tunnels. An extra door shall be provided to the escape tunnel to facilitate escape from the drill floor and minimise exposure of people in this area to hazardous events. Watertight doors in the escape tunnels shall be kept open unless a visiting vessel is approaching.</p> <p>The helideck refuelling tank is now located on deck 10 behind a firewall. The area is protected by a deluge system which can be operated remotely. In addition, the Heli guard station has been equipped with CCTV for improved fire monitoring. This use of the helideck refuelling tank is not planned for the campaign.</p> |

| HAZARD                      | MAJOR ACCIDENT / HAZARDS PREVENTION MEASURES                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                             | <p>H<sub>2</sub>S detectors shall be in the areas where gas is most likely to be released. Detection of toxic gas (10 ppm) shall give an alarm. High toxic gas (20 ppm) shall initiate the relevant emergency shutdown actions, including automatic control of the ventilation system in the related area. Where drilling into a potentially sour reservoir is anticipated, appropriate additional measures to manage the H<sub>2</sub>S hazard shall be put in place.</p> <p>The storage and use of hazardous or potentially toxic materials kept onboard shall be strictly controlled by MODU procedures. Small toxic gas releases resulting from normal or primary well control operations or from core breakout shall be controlled by standard contingency procedures.</p> <p>The drillship Emergency Response Plan shall define alarm, shutdown, firefighting, muster, evacuation, escape and rescue arrangements for fire, explosion and toxic-release events.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Ship Collision              | <p>Despite the 500-metres restricted area, the MODU shall have a vessel-specific collision risk management plan, informed by the site-specific Shipping and Navigation Assessment. The plan shall include measures to provide adequate warning time, continuous monitoring of marine traffic by competent watchkeepers using AIS, ARPA and other available navigational aids, and appropriate communications, lights, shapes and signals reflecting the MODU's operational status.</p> <p>Radio communications, light signals and sound signals shall be used by the MODU and available support or standby vessels to warn vessels presenting a collision threat.</p> <p>The MODU and Platform Supply Vessels shall comply with COLREGs, SOLAS, applicable Flag State requirements and relevant national requirements, including display of the appropriate navigation lights, marks and day shapes for a vessel Restricted in its Ability to Manoeuvre.</p> <p>Subject to authorisation by the competent Greek authorities, a 500 m safety zone shall be maintained around the MODU during well operations. Project support vessels shall assist in monitoring the zone and communicating with approaching vessels, as required.</p> <p>Where an imminent collision threat cannot be managed through warning or vessel-intervention measures, the applicable emergency response, DP and disconnect procedures shall be implemented in accordance with the WSOG and MODU procedures.</p> |
| Loss of Dynamic Positioning | <p>The MODU's dynamic-positioning system shall meet IMO DP Equipment Class 3 requirements or an equivalent Class 3 notation accepted by the relevant Flag State and classification society. Loss or degradation of station-keeping shall be managed in accordance with the WSOG and applicable MODU procedures, including emergency disconnection and movement off location where required.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Dropped Objects             | <p>Critical areas, including the Temporary Refuge, control rooms, switch rooms and fuel-oil tanks, shall be protected against dropped-object impacts by plated structural decks. Lifting procedures shall prohibit lifting heavy loads directly over live hydrocarbon-containing equipment.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Extreme Weather             | <p>The MODU shall be operated within the designed environmental limits.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Helicopter Accidents        | <p>The helideck shall be designed, certified, operated and maintained in accordance with applicable Flag State, classification, aviation and helicopter-operator requirements.</p> <p>The helideck refuelling tank shall be located behind a firewall and the area is protected by a remotely operated deluge system. Additionally, the Heli guard station is equipped with CCTV for improved fire monitoring to reduce the likelihood of a helideck fire escalating.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

**Table 2-10: Proposed emergency response measures**

| EMERGENCY CATEGORY                    | EMERGENCY RESPONSE MEASURES                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Immediate Actions and General Command | <p>The emergency response shall be managed in the following strict priority order: (1) Protect life, (2) Stabilise and regain control, (3) Protect the environment, (4) Protect the asset, and (5) Preserve evidence.</p> <p>The Bronze Leader (on-scene command role defined by the ERP) shall assume on-scene tactical command, stop affected work, isolate energy and ignition sources, establish exclusion zones, and coordinate the initial emergency response. Emergency alarms shall be activated, personnel shall be accounted for at muster stations, and procedures for partial evacuation, full evacuation or abandonment shall be initiated where required.</p> |

| EMERGENCY CATEGORY                     | EMERGENCY RESPONSE MEASURES                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Blowout and Well Control               | In the unlikely event of a blowout or other loss of well control, drilling operations shall be suspended, and the well shall be secured using the applicable well-control equipment and procedures. Well pressure, flow and barrier status shall be monitored and appropriate well-control actions implemented in accordance with the Project Well Control Bridging Document. The BOP, E-SID, ESD, EDS and applicable DP response procedures shall be activated where required by the circumstances and relevant operating procedures. Where control cannot be restored using available well-control measures, the applicable source-control arrangements, including subsea capping and relief-well planning, shall be initiated.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Fire and Explosion                     | In the event of a fire or explosion, trained emergency response teams shall deploy the applicable fixed firefighting systems, isolate fuel and ignition sources, undertake boundary cooling, and control smoke to protect escape routes, as appropriate to the circumstances. Ventilation shall be managed, access to affected areas shall be restricted, and breathing apparatus shall be used where necessary to protect emergency responders.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Marine Emergencies and Man Overboard   | Dynamic Positioning drive-off or drift-off events shall be managed in accordance with the Well-Specific Operating Guidelines and applicable MODU procedures, including emergency disconnection where required. Following collision or structural damage, flooding control, stability assessment and pollution containment measures shall be initiated as appropriate to the nature of the event. During man-overboard incidents, rescue equipment shall be deployed immediately, visual contact shall be maintained where practicable, and available support vessels and, where required, the competent search-and-rescue authorities shall be coordinated in accordance with the applicable emergency procedures.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Medical Emergencies and Medevac        | An injured person (IP) shall be assessed and stabilised onboard by the Rig Medic with support from topside medical advisers where required. Medical evacuation shall be undertaken by helicopter or vessel, depending on the IP condition and prevailing operational conditions, to a suitable receiving medical facility. For multiple casualties or complex rescue operations, assistance shall be requested from and coordinated through the Joint Rescue Coordination Centre and the Hellenic Coast Guard, as required.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Toxic Gas (Hydrogen Sulphide) Releases | In the unlikely event of a toxic-gas release, personnel shall be relocated to designated safe areas upwind, crosswind or within protected spaces. Heating, Ventilation and Air Conditioning (HVAC) controls shall be used to limit gas ingress, while escape sets, breathing apparatus and exclusion zones shall be implemented as required to protect personnel. Where required by the nature and scale of the release, external plume-dispersion modelling may be undertaken to assess potential offsite impacts.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Spill and Pollution Response           | <p>The source of the spill shall be controlled where safe and practicable, and the activity associated with the loss of containment shall be suspended or isolated, as appropriate. Initial containment, recovery and protection measures shall be selected and deployed taking account of the substance released, the location and scale of the spill, prevailing conditions and available response capability. The response shall be escalated according to the nature and scale of the incident, with additional personnel, equipment and specialist response resources mobilised where required under the applicable vessel and Project spill-response arrangements.</p> <p>Where the spill exceeds onsite response capability, the competent authorities shall be notified, and additional response resources shall be mobilised in accordance with the applicable spill-response arrangements. The detailed response arrangements, including response organisation, notification, escalation, available resources and coordination with contractors and competent authorities, shall be defined in the applicable emergency and spill-response plans. Any activation of the National Contingency Plan shall be determined by the competent authorities. Chemical dispersants shall only be used following approval by the competent authority. Spill monitoring, waste management and environmental surveillance shall continue as appropriate to the nature and scale of the incident until response and recovery operations are completed.</p> |
|                                        | Response to oil pollution incidents will be undertaken in accordance with the applicable vessel Shipboard Oil Pollution Emergency Plan (SOPEP) and Project Emergency Response Plan which spill-response arrangements are included. Releases involving other chemicals will be managed through the relevant vessel and Project emergency procedures, taking account of the substance involved, its Safety Data Sheet and the nature and scale of the release.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| EMERGENCY CATEGORY                                 | EMERGENCY RESPONSE MEASURES                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Special Hazards (Security, Cyber and Radiological) | <p>Security and cyber incidents shall be managed in accordance with applicable MODU, contractor and Project procedures, including, as appropriate, access control, isolation of affected Information Technology (IT) and Operational Technology (OT) systems, and implementation of manual operating procedures where safe.</p> <p>For radiological incidents, affected work shall be stopped, the affected area shall be isolated, access shall be controlled, and suitably qualified radiation-protection personnel shall be consulted or mobilised in accordance with the relevant licensed contractor's approved procedures and applicable EEAE requirements.</p> |

**Table 2-11: Proposed Climate Change Adaptation Measures**

| CLIMATE-RELATED HAZARD                                                                | CLIMATE CHANGE ADAPTATION MEASURE                                                                                                                                                                                      |
|---------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Flooding of Onshore Installations (coastal, fluvial, pluvial or groundwater flooding) | Coordinate Project flood-risk arrangements with the Port of Igoumenitsa and the Corfu International Airport operators, taking into account the applicable facility flood-management and emergency-response procedures. |
|                                                                                       | Locate or protect Project-critical equipment, electrical systems, chemicals and hazardous materials taking account of the flood risk within the areas allocated for Project use.                                       |
|                                                                                       | Use existing drainage and flood-protection arrangements at the onshore support facilities, supplemented by temporary Project controls where reasonably practicable and agreed with the relevant facility operator.     |
|                                                                                       | Monitor applicable weather and flood warnings and implement arrangements for the timely securing, protection or relocation of mobile Project equipment and hazardous materials where required.                         |
|                                                                                       | Review access and logistics arrangements in response to forecast or actual flooding and implement practicable alternative arrangements where required and available.                                                   |
| Changes in wind characteristics                                                       | Apply the operational wind limits established for the MODU, lifting operations, vessel transfers and helicopter operations.                                                                                            |
|                                                                                       | Monitor weather conditions and forecasts using the meteorological information and decision-support arrangements available to the Project, MODU, vessels and aviation contractors.                                      |
|                                                                                       | Plan and conduct marine and aviation operations in accordance with applicable weather-related operating limits and procedures.                                                                                         |
|                                                                                       | Use a MODU and support vessels that comply with applicable Flag State, classification and regulatory requirements for the environmental conditions relevant to the Project.                                            |
|                                                                                       | Secure deck equipment in accordance with the MODU's and vessels' applicable procedures for forecast adverse weather.                                                                                                   |
|                                                                                       | Conduct lifting and crane operations within the applicable equipment limits and approved operating procedures, including relevant wind limits.                                                                         |
|                                                                                       | Postpone, suspend or reschedule offshore transfers, lifting activities and helicopter operations where applicable weather limits are approached or exceeded.                                                           |
|                                                                                       | Maintain contingency arrangements for temporary suspension of operations and placing the well, MODU and associated activities in a safe condition during adverse weather.                                              |

## 2.12 Environmental and social monitoring

**Table 2-12: Environmental and Social Monitoring Plan for the Asopus Exploration drilling Project in Block 2**

(Note: The sampling stations and methodologies defined in this monitoring plan are derived from the Phase 2 Environmental and Social Baseline Study (ESBS) report (Annex 02 of this ESIA) to ensure comparability of operational and post-drilling results with pre-drilling baseline conditions.)

| ITEM NO.   | ENVIRONMENTAL / SOCIAL PARAMETER        | INDICATOR                                 | MEASURABLE PARAMETERS                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | SAMPLING / OBSERVATION METHODOLOGY                                                                                                                                                                                                                                                                                    | SAMPLING / OBSERVATION FREQUENCY                                                                                               | LOCATIONS & SPATIAL EXTENT                                                                                                                                                                                                |
|------------|-----------------------------------------|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>1</b>   | <b>SEAWATER AND SEDIMENT</b>            |                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                                                                                                                                                                                                                                                                                                                       |                                                                                                                                |                                                                                                                                                                                                                           |
| <b>1.1</b> | <b>Seawater</b>                         | Seawater Quality                          | Continuous Vertical Profiling: Temperature, Salinity, Conductivity, pH, Dissolved Oxygen, Fluorescence (Chlorophyll-a), Turbidity.<br>Laboratory Water Chemistry: Total Suspended Solids, Total Organic Carbon, Nutrients (Total Nitrogen, Total Phosphorus, Orthophosphate, Ammoniacal-N, Nitrous-N, Nitric-N), Heavy & Trace Metals (Al, As, Ba, Cd, Cr-tot, Cu, Co, Fe, Pb, Hg, Ni, Sn, V, Zn), Total Petroleum Hydrocarbons (Light fraction C6–C10, Heavy fraction C10–C40) and 16 Priority Polycyclic Aromatic Hydrocarbons. | Continuous Profiling: Multiparameter probe lowered continuously across the full vertical water column (surface to seabed).<br>Water Sampling: Niskin bottle rosette sampler collecting water at 3 discrete depths (surface, middle, bottom). Chemical results evaluated against Directive 2013/39/EU & SQA-MA limits. | Post-drilling campaign / one off                                                                                               | Asopus-1 Station Group: stations D2a (East), D3a (500 m north), D4a (West), D5a (500 m south); near-field station D1a (subject to a safe operational offset from operations); and one Blank station D6a (~1 km distance). |
| <b>1.2</b> | <b>Cuttings</b>                         | Cuttings Monitoring                       | Grain size distribution, sediment classification, total organic carbon, carbonates, nutrients, heavy & trace metals (including Vanadium - V), total petroleum hydrocarbons (light fraction C≤12, heavy fraction C>12) and 16 priority polycyclic aromatic hydrocarbons.                                                                                                                                                                                                                                                           | Riser cuttings collected on board the drilling vessel, homogenized, and transferred to laboratory sample containers. Evaluated against HCMR Sediment Quality Guidelines.                                                                                                                                              | Once per drilling section.                                                                                                     | Mobile offshore drilling unit during drilling operations at Exploration Well Asopus-1.                                                                                                                                    |
| <b>1.3</b> | <b>Sediment</b>                         | Sediment Monitoring                       | Visual seabed inspection, sediment temperature, pH, redox potential, grain size, total organic carbon, carbonates, nutrients, heavy & trace metals (Al, As, Ba, Cd, Cr-tot, Cu, Co, Fe, Pb, Hg, Ni, Sn, V, Zn), total petroleum hydrocarbons (light fraction C≤12, heavy fraction C>12), 16 priority polycyclic aromatic hydrocarbons, and microplastics.                                                                                                                                                                         | Surface sediment sampling via Van Veen grab sampler (2 x 0.1 m²). Laboratory results evaluated against EU legislation / HCMR SQG ERLs.                                                                                                                                                                                | Post-drilling campaign / one off                                                                                               | Asopus-1 Station Group: stations D2a (East), D3a (500 m north), D4a (West), D5a (500 m south); near-field station D1a (subject to a safe operational offset from operations); and one Blank station D6a (~1 km distance). |
| <b>1.4</b> | <b>Ballast Water</b>                    | Ballast Water Management                  | Verification of ballast water treatment, operational logs, and discharge standards compliance.                                                                                                                                                                                                                                                                                                                                                                                                                                    | Review of the approved Ballast Water Management Plan, Ballast Water Record Book and relevant operational records. Any treatment system alarm, deviation or malfunction will be managed in accordance with the approved plan and applicable vessel procedures.                                                         | During applicable ballast-water management or discharge operations and following any system alarm, deviation or malfunction.   | On board the mobile offshore drilling unit.                                                                                                                                                                               |

## 3 Brief project description

---

The Project comprises a single offshore exploration well (Asopus-1) within Block 2 of the Greek EEZ in the northwestern Ionian Sea. It is an exploration activity designed to evaluate the presence and characteristics of potential hydrocarbon-bearing formations. Operations will be carried out using the Stena DrillMAX MODU and associated marine and aviation support services. The scope of the Project includes drilling, formation evaluation, and permanent plugging and abandonment of the well. No field development, hydrocarbon production, or export facilities are part of the Project scope assessed in this ESIA. The assessed design envelope covers one well, within a maximum offshore operational area of 0.79 km<sup>2</sup>, including a 500 m safety/exclusion zone around the drilling unit.

### 3.1 Project elements

---

The Asopus-1 exploration well is located in Block 2 within the Greek Exclusive Economic Zone (EEZ) in the northwestern Ionian Sea. The site lies in deep water (~840 m), approximately 44 km offshore Othoni Island and about 3.2 km from the Italian EEZ boundary.

The well location was determined through the interpretation of available geological and geophysical data and the assessment of operational feasibility, water depth, navigational constraints, environmental sensitivities, and adherence to the boundaries of the Block 2 Lease Agreement. No subsea infrastructure or coastal installations are present in the immediate vicinity of the well location.

A temporary 500 m safety zone will be established around the mobile offshore drilling unit (MODU) during drilling operations, in accordance with applicable regulatory requirements and recognised offshore industry practice. The safety zone is intended to protect navigation and offshore operations.

The Project consists of a temporary offshore drilling operation supported by existing onshore logistics and aviation infrastructure. The principal offshore component is the drilling of the Asopus-1 well in approximately 840 m water depth with the Stena DrillMAX drillship, while terrestrial support will be provided through existing facilities at the Port of Igoumenitsa and Corfu International Airport (CFU). The activity is temporary in nature and limited to a single exploration well. Apart from the well, no major new permanent infrastructure is required either offshore or onshore.

#### 3.1.1 Main infrastructure and activities

---

The Asopus-1 well is a vertical exploration well designed to evaluate subsurface geological formations. It will be constructed in staged sections, each reinforced with suitable barriers, including steel casing and cement to maintain well integrity and prevent environmental release. Drilling fluids will be used to stabilise the wellbore and transport cuttings to the surface once the riser is connected.

After drilling and evaluation, the well will be plugged and abandoned in accordance with applicable regulatory requirements and recognised offshore industry practices. The final well design will be confirmed during detailed well planning and submitted to the relevant authorities in a timely manner for approval.

The principal project infrastructure is the Stena DrillMAX drillship, a dynamically positioned DP3 mobile offshore drilling unit (MODU) designed for deepwater drilling. The vessel has indicative dimensions of 228

m in length, 42 m in beam, and can operate in water depths up to 3,000 m. This operating envelope exceeds the maximum anticipated project water depth of approximately 840 m, confirming the technical suitability of the selected unit for the planned activities.

Offshore activities include mobilisation of the drilling unit, well construction and evaluation, operation of support vessels and remotely operated vehicle (ROV) systems, routine marine and aviation logistics, and subsequent plugging and abandonment (P&A) of the well. Drilling operations will utilise water-based drilling fluids (WBM), with no planned use of non-aqueous drilling fluids. The Stena DrillMAX will maintain position using a dynamic positioning system, and no anchors are planned, thereby avoiding anchor-related seabed disturbance.

The drilling programme is designed to progress sequentially from shallow formations to the target total depth, with well integrity maintained at all stages through drilling, casing, cementing, and pressure control systems, which will be timely submitted to HEREMA for approval as part of the Notification of Well Operations (NoWO) prior to drilling.

Drilling begins with riserless operations in shallow sections, where seawater and viscous sweeps are used, and cuttings are discharged in the immediate vicinity of the well location. This includes conductor jetting and drilling of the top-hole sections required to establish the well structure.

After installation of the blowout preventer (BOP) and marine riser, drilling continues in a controlled, closed-loop environment.

The deeper sections of the well (17½", 12¼", and 8½") are drilled with progressively smaller casing strings installed and cemented at each stage to ensure zonal isolation and structural stability. Drilling fluids are circulated between the drillship and the wellbore. Cuttings are returned to the vessel and processed onboard, while fluids are conditioned and reused where appropriate.

Well pressure is continuously managed through mud weight and, where required, Managed Pressure Drilling (MPD) may be used to drill the deeper formation target(s). If abnormal pressure conditions occur (a "kick"), the fluid hydrostatic pressure and the MPD backpressure (if applicable) will provide margin to manage uncertainty. In the unlikely scenario that an influx enters the well, MPD may be used to manage pressure conditions within the drilling window. Should a well control event occur, well control procedures would be implemented using the BOP and associated well control systems in accordance with the Well Control Bridging Document.

In the unlikely event of failure of the primary barrier (hydrostatic pressure) and secondary barrier (BOP), a pre-installed Emergency Shut-In Device (E-SID) is located subsea within the stack between the wellhead and the blowout preventer. The E-SID provides an additional independent means of isolating the well and can be activated to shut in the well in accordance with established well control procedures, thereby significantly reducing the potential for escalation.

Formation evaluation is carried out during and after drilling using a combination of logging-while-drilling (LWD), wireline logging, mudlogging, and biostratigraphy. These methods provide continuous geological and petrophysical data and support real-time operational decisions. A Vertical Seismic Profile (VSP) may also be conducted as part of wireline logging operations. Where undertaken, VSP activities will constitute a temporary source of underwater acoustic energy during the drilling programme and are assessed further in Chapter 10.

A range of contingency measures is included within the drilling design envelope, such as:

- Side-tracking or re-spudding if well conditions require bypassing or restarting sections,
- Temporary suspension in cases of weather or operational constraints,
- Loss circulation treatments using specialist materials,
- Emergency disconnect procedures in extreme scenarios,
- Limited use of mechanical pipe severance tools if required.

Overall, the drilling phase is characterised by a tightly controlled, sequential operation with multiple engineered barriers to prevent loss of well control, and a suite of standard offshore practices to manage environmental risks, particularly related to drilling discharges, underwater noise, and logistical emissions.

### 3.1.2 Support infrastructure

A logistics system will support the drilling operations, comprising platform supply vessels (PSVs) transporting equipment, materials, and consumables between the Port of Igoumenitsa and the drillship; helicopter transfers between the drillship and Corfu International Airport (CFU) for personnel transport and emergency response activities; and temporary logistics facilities within the existing port infrastructure at Igoumenitsa. No new permanent construction is required.

Marine support will be provided by two platform supply vessels (PSVs) operating between the drillship and Igoumenitsa.

Onshore activity is limited to the temporary use of existing port infrastructure at the Port of Igoumenitsa and CFU. No construction, expansion, or modification of facilities is required. The supply base will support the routine handling of materials and waste within an existing commercial port environment, operated in accordance with existing port management procedures and applicable permits.

A temporary onshore logistics base will be established within a secure, restricted zone at the Port of Igoumenitsa to support the offshore exploration drilling campaign. This temporary hub will function as a storage, staging, and load-out area for equipment and materials, with temporary installations such as fencing, containerised structures, and limited personnel facilities. All operations will be coordinated with port authorities and, where practicable, scheduled to avoid peak congestion periods. All temporary installations will be removed upon completion of the campaign.

Corfu International Airport will support routine helicopter crew transfer operations, including use of a temporary hangar installed within the existing airport footprint. These support components will utilise existing airport and port infrastructure and will be temporary. Helicopter operations will use existing airport infrastructure and established flight routes and may also support emergency response if required.

Helicopters will primarily support routine crew changes (~50–60 personnel per week) and be available in the unlikely event of an emergency medical evacuation. Operations will be conducted in accordance with aviation safety regulations, in coordination with relevant authorities, and subject to meteorological and air traffic control constraints. Routing will consider safety and, where practicable, minimise overflight of sensitive onshore areas.

## 3.2 Development phases

The Project will be executed as a temporary offshore exploration drilling campaign currently planned to commence in February 2027, subject to operational and regulatory requirements. No field development or hydrocarbon production activities form part of the Project.

The activity sequence includes mobilisation and preparation, drilling and well evaluation, followed by well decommissioning, rig release, and removal of temporary onshore facilities. The expected offshore campaign duration is approximately 57 days for a dry well and 67 days if hydrocarbons are encountered. Quantities presented in this chapter are based on the planned operational duration of up to 67 days, while the 90-day duration represents a conservative scheduling envelope for environmental assessment purposes.

All offshore activities will cease once the exploration programme is completed and the drillship departs the site. The activity will be conducted on a continuous 24-hour basis during offshore operations.

### 3.2.1 Mobilisation phase

The mobilisation phase consists primarily of mobilisation, temporary installation and operational preparation activities. This phase includes the readiness of the MODU and support vessels, the temporary configuration of onshore support areas, and the establishment of aviation and shore base support required for the drilling campaign.

#### 3.2.1.1 Offshore activities

During mobilisation, offshore activities will comprise pre-mobilisation checks, verification of vessel readiness, loading of materials, consumables, and equipment, transit of the MODU to the Asopus-1 well location, and preparatory activities prior to the commencement of drilling operations. The MODU and support vessels will undergo statutory, technical and environmental readiness checks, including verification of pollution prevention systems, ballast water management arrangements, and operational safety systems, prior to entering the Project operational area.

The drilling unit will be loaded with the required consumables and materials, such as fuel, water, equipment, and stores, before departing its mobilisation location abroad and will be supplemented through the logistics arrangements. Where applicable, items will be transported to the Igoumenitsa supply base using existing transport routes, primarily via established road freight services and, where necessary, by coastal or regional marine transport.

No drilling activities or well-related seabed intervention will take place during mobilisation. Offshore drilling will begin only after the drilling unit arrives at the well location, completes required positioning and pre-spud checks, and meets all regulatory, operational, and safety requirements.

The drillship will mobilise to the well location under its own propulsion and, upon arrival, will be positioned using its DP3 dynamic positioning system, without the use of anchors. Temporary acoustic positioning transponders will be deployed on the seabed to support accurate station-keeping, and the unit will be ballasted as required to achieve drilling draft and operational stability. Prior to spudding the well, an ROV will

undertake a seabed inspection in the immediate vicinity of the proposed well location to verify seabed conditions and identify any obstructions or environmental features relevant to drilling operations.

Marine logistics during mobilisation will include transfer of drilling materials, bulk supplies, water, fuel, provisions and operational equipment from the shore base to the MODU using platform supply vessels (PSVs). Support vessels will also assist with offshore readiness, initial resupply and operational support in advance of drilling commencement. Mobilisation activities will be temporary and confined to the period necessary to safely establish the drilling unit on location and prepare for the start of drilling operations.

### 3.2.1.2 Onshore logistics support and transport base

---

The supply base will function solely as a logistics interface between onshore services and offshore operations. During mobilisation, the Igoumenitsa Supply Base will provide facilities for the receipt, storage, handling and dispatch of drilling materials, equipment and consumables associated with offshore operations, as well as support vessel logistics and personnel coordination. Temporary installations may include portable office units, security and access-control arrangements, designated cargo and waste zones, and supporting mobile equipment such as forklifts, trailers, heavy-duty trucks and call-out crane services. No dredging, quay modification, land reclamation or major ground works are foreseen.

Where required, the supply base may temporarily store oil spill Tier 1 response equipment, such as booms, skimmers and absorbents, in designated areas to support rapid mobilisation.

A temporary helicopter support arrangement will also be established at Corfu Airport within the existing airport operational boundary. The temporary hangar will provide sheltered facilities for helicopter parking, routine inspection, maintenance support, equipment storage and operational preparation associated with crew transport and emergency response activities.

## 3.2.2 Drilling phase

---

The operation phase consists of continuous offshore drilling and logistics support, conducted on a 24-hour/day, 7-day/week basis. The offshore unit will remain on station only for the time required to complete the exploration drilling programme. During operations, the persons on board (POB) may reach up to 180 personnel on the drillship, while support vessels typically carry 12–18 personnel each.

### 3.2.2.1 Offshore activities

---

Offshore activities will include deployment and positioning of the MODU using dynamic positioning, conductor jetting, drilling of successive well sections, casing and cementing, mud circulation and solids control, wireline and logging-while-drilling (LWD) operations, and well plug-and-abandonment. The drilling programme will utilise water-based mud systems throughout and will extend to an indicative final depth of approximately 3,750 m measured depth below seabed through five main well sections.

The MODU will remain on station without anchors, and a temporary 500 m safety zone will be maintained around the drilling unit for the duration of drilling operations. Routine offshore support will be provided by up to two platform supply vessels (PSVs) and regular helicopter crew change operations between the MODU

and CFU, together with intermittent drillship-deployed ROV support for seabed inspection, subsea equipment monitoring and post-operation clearance verification.

Offshore activities will involve the use and storage of drilling materials, fuel, and water, as well as the management of wastes and discharges during the campaign. All offshore wastes and discharges will be managed in accordance with applicable Greek and EU legislation and requirements, MARPOL requirements and project-specific environmental and emergency response procedures.

### 3.2.2.2 Onshore logistics support and transport base

---

A temporary onshore logistics base will be established within a secure, restricted zone at the Port of Igoumenitsa to support the offshore exploration drilling campaign and will be fully mobilised before the drilling unit arrives at the well location. This temporary hub will serve as a storage, staging and load-out area for equipment and materials, including secure fencing, storage shelters, containerised structures, and limited personnel facilities. Activities at the logistics base will be coordinated with the Port Authority and port operators as required.

The supply base is expected to operate within a defined port area of up to approximately 10,000 m<sup>2</sup> of open storage space, supported by covered storage areas and access to a dedicated quayside. Operations will be supported by conventional equipment such as forklifts, trailers, trucks and crane services, with designated zones for storage, cargo handling, waste handling and traffic circulation.

In parallel, Corfu International Airport will support routine helicopter operations for crew changes and emergency response, using temporary project-specific arrangements within the existing airport footprint.

All onshore logistics activities will be temporary in nature and conducted in accordance with applicable port, airport, environmental, and safety requirements.

## 3.2.3 Decommissioning phase

---

Following completion of the exploration drilling and formation evaluation, the Project will enter a decommissioning phase during which the well will be plugged and abandoned, the remaining equipment and materials will be backloaded, the rig will demobilise, items will be returned to vendors where possible, and temporary onshore components will be disassembled. Decommissioning will be implemented in accordance with the approved well programme, applicable regulatory requirements and recognised offshore industry practice.

### 3.2.3.1 Offshore decommissioning and restoration

---

Offshore decommissioning includes plugging and abandonment (P&A) of the well with verified barriers, followed by the retrieval of the marine riser, BOP and ancillary subsea equipment, and demobilisation of the MODU. The wellhead will remain in place following abandonment, in accordance with the approved abandonment programme and recognised industry practice for deepwater wells, where it does not present a constraint to navigation, fishing activities, or routine marine use of the area. A post-operation ROV seabed survey will be undertaken to inspect the vicinity of the wellbore.

### 3.2.3.2 Onshore decommissioning and restoration

Onshore decommissioning will include removal of temporary logistics installations, portable offices, temporary storage arrangements, fencing and project-specific equipment from the supply base and helicopter support areas. All waste streams and remaining materials will be removed from the site, and the operational areas will be restored to their original or otherwise agreed operational condition in coordination with the relevant port and airport authorities.

## 3.3 Raw materials, energy and water resources

The Project requires a range of consumables, materials and utilities to support offshore drilling operations and temporary logistics activities. The principal resource demand relates to offshore operations, including drilling materials, fuel, water and power generation. Onshore resource demand is comparatively minor and limited to temporary logistics support functions.

### 3.3.1 Requirements of raw materials

Raw material and chemical requirements are principally associated with well construction and drilling support. These include steel tubulars and casing, cement, barite, water-based mud additives, operational chemicals, and general offshore consumables required for safe execution of the drilling program. Only water-based mud systems are proposed; non-aqueous drilling fluids are not part of the Project basis.

#### 3.3.1.1 Offshore activities

Chemical selection is based on technical performance and environmental compatibility, with preference given to substances classified as Pose Little Or No Risk (PLONOR). The main chemicals used will be drilling and cementing materials for the riserless and riser-based well sections. Based on the current drilling chemicals inventory (Chemical Use Plan, Annex 05), the estimated offshore chemical requirement is approximately 5,635 t, comprising around 4,217 t of water-based mud (WBM) additives, 1,418 t of cement and cement additives, and about 0.75 t of spacer chemicals.

For the riserless sections, the estimated requirement is approximately 1,595 t with the principal materials comprising Class G cement (725 t), barite (375 t - contingency) and NaCl (297 t), together with smaller quantities of PAC, CMC, starch, XC polymer, caustic soda and other additives used for mud conditioning and cement performance.

For the riser-based sections, the estimated requirement increases to approximately 4,040 t, reflecting the greater depth and complexity of the deeper hole sections. The main materials in this phase include barite (1,372 t - contingency), NaCl (581 t), sized CaCO<sub>3</sub> (462 t), Class G cement (499 t), KCl (388 t), oxygen scavenger (180 t) and bentonite (136 t - contingency), supplemented by additional mud and cement additives required for wellbore stability, fluid loss control and cementing.

Overall, offshore raw material demand will be driven primarily by weighting agents, cement systems, inhibition salts and fluid-control additives. All chemicals will be stored, handled and transferred in

accordance with the approved drilling fluids programme and applicable environmental, health and safety requirements.

### 3.3.1.2 Onshore logistics support and transport base

---

Onshore raw materials will comprise tubulars, wellheads, packaged drilling supplies, maintenance materials, temporary chemical stocks and general logistics consumables. These materials will be held only temporarily at the supply base and managed through designated laydown, segregation and handling zones. No bulk liquid mud plant will be installed at Igoumenitsa, and no large-scale process storage is required onshore.

## 3.3.2 Water requirements

---

Water demand is associated with drilling activities, cement preparation, cooling systems, domestic use, sanitation, equipment washdown and ballast operations. The Project is designed to minimise freshwater import by relying primarily on direct seawater abstraction and onboard water production systems.

### 3.3.2.1 Offshore activities

---

Water demand for the Project will be met primarily using seawater and onboard desalination systems installed on the Stena DrillMAX. Seawater will be used for drilling fluid preparation and cementing operations, reducing the requirement for externally supplied freshwater by approximately 23,000 m<sup>3</sup> over the course of the campaign.

Freshwater for domestic, sanitary, and operational purposes will be produced onboard using reverse osmosis (RO) units and a thermal evaporator, with production averaging 90 m<sup>3</sup>/day and peaking at 230 m<sup>3</sup>/day. Freshwater consumption is primarily associated with sanitary use (70.5 m<sup>3</sup>/day), boiler operation (up to 15 m<sup>3</sup>/day) and deck washing (5.7–8.0 m<sup>3</sup>/day).

As a contingency measure, up to 954 m<sup>3</sup> of potable water may be supplied from shore facilities in the unlikely event of a prolonged outage of the onboard water production systems.

The largest seawater requirement is for the cooling water system, which will abstract approximately 90,080 m<sup>3</sup>/day on average (97,760 m<sup>3</sup>/day at peak). Additional seawater will be used as feedwater for the desalination systems (~1,415 m<sup>3</sup>/day) and for ballast operations, which may require temporary seawater transfers during ballast exchanges (up to approximately 28,000 m<sup>3</sup> at rig release).

Overall, the Project's reliance on seawater and onboard freshwater generation minimises demand for externally supplied freshwater resources.

### 3.3.2.2 Onshore logistics support and transport base

---

Onshore water demand is expected to be low and will be supplied through existing port and airport utilities. Use will be limited to staff welfare, hygiene, cleaning and minor operational needs associated with short-term cargo handling and logistics support.

### 3.3.3 Energy requirements

#### 3.3.3.1 Offshore Activities

---

Energy consumption associated with the Project will be dominated by offshore operations, particularly fuel use by the Stena DrillMAX, support vessels and helicopter transport. Based on a conservative assessment, the drillship is expected to consume approximately 43 tonnes/day of marine gas oil (MGO) during drilling operations, resulting in an estimated 2,881 tonnes of fuel use over the 67-day campaign. The two support vessels are estimated to consume up to 25 tonnes/day, equivalent to approximately 1,675 tonnes over the campaign, under the conservative assumption that both vessels are continuously underway throughout the campaign.

Total offshore MGO consumption is therefore conservatively estimated to be 4,556 tonnes. For context, the estimated offshore MGO consumption for the Project (approximately 4,556 tonnes) is broadly comparable to the fuel capacity of a large ocean-going cruise vessel like those operating in the wider area of the North Ionian Sea. Helicopter operations for crew changes and logistics are conservatively estimated to consume approximately 134 tonnes of Jet A-1 fuel over the campaign.

All marine vessels will use MGO or equivalent compliant fuel with a maximum sulphur content of 0.10%, in accordance with MARPOL Annex VI and Mediterranean Sea SOx Emission Control Area requirements.

#### 3.3.3.2 Onshore logistics support and transport base

---

Onshore energy consumption will be limited to temporary logistics activities at the Port of Igoumenitsa and personnel transfers via Corfu International Airport. Shore base energy use will primarily comprise electricity supplied through the existing port grid and diesel consumption by cargo-handling equipment, forklifts, cranes and transport vehicles.

Onshore fuel demand is primarily associated with trucks, forklifts, cranes and light vehicles supporting cargo transfer and waste handling. Based on the ESIA assessment, onshore support activities are a comparatively minor fuel consumer relative to offshore operations, with no requirement for major permanent fuel storage installations. Average fuel consumption for shore base equipment is conservatively estimated at approximately 353 litres/day and is expected to remain modest due to the temporary nature of the Project and reliance on existing infrastructure.

No additional energy generation facilities or dedicated energy supply systems will be required.

## 3.4 Discharges and waste

### 3.4.1 Wastewater

#### 3.4.1.1 Offshore activities

Operational discharges from the Stena DrillMAX and associated support vessels will be managed in accordance with MARPOL Annexes I, IV and V, the Ballast Water Management Convention, and applicable Greek, EU, and flag-state requirements, consistent with the Offshore Protocol principles of pollution prevention, source minimisation and use of best available techniques.

Over the 67-day campaign, the main discharge streams are as follows:

- Bilge water / oily drainage: approximately 302 m<sup>3</sup> total (average 4.5 m<sup>3</sup>/day, peak 20 m<sup>3</sup>/day), treated via oily water separators to a 15 ppm oil limit before discharge.
- Deck drainage (rainfall + washdown): approximately 21,420 m<sup>3</sup> total (average ~320 m<sup>3</sup>/day, peak 525 m<sup>3</sup>/day) as the well will be drilled during the rainy season. Potentially contaminated drainage from open decks, the drill floor, and other operational areas is managed through segregation and oily water treatment where required.
- Boiler blowdown: approximately 36 m<sup>3</sup> total, released intermittently during maintenance cycles.
- Ballast water: approximately 29,474 m<sup>3</sup> total operational discharge, plus a one-off ~28,000 m<sup>3</sup> discharge during de-ballasting at end of drilling.
- Desalination brine: approximately 94,577 m<sup>3</sup> total (evaporator and RO), discharged after dilution within the cooling water systems.
- Treated sewage: approximately 1,371 m<sup>3</sup> total (20.5 m<sup>3</sup>/day) treated to MARPOL Annex IV standards
- Grey water: approximately 3,015 m<sup>3</sup> total (45 m<sup>3</sup>/day) discharged via segregated drainage systems in accordance with applicable MARPOL requirements.

The total quantity of cooling water will be approximately 6.0 million m<sup>3</sup> over the Project, with an average flow of around 90,080 m<sup>3</sup> per day and peak flows reaching approximately 97,760 m<sup>3</sup> per day. Cooling water comprises non-contact seawater that is returned to the marine environment following heat exchange and is not expected to contain process contamination.

Other wastewater streams (bilge, ballast, sewage and desalination brine) are subject to treatment, monitoring and regulatory controls to ensure compliance with MARPOL and associated environmental standards.

All hazardous and non-routine liquid waste streams (including waste oils, chemicals, paint residues and spill clean-up materials) will be fully contained and transferred to shore for authorised treatment or disposal, with no planned marine discharge.

### 3.4.1.2 Onshore logistics support and transport base

Portable chemical toilets will be provided for about six shore base personnel within the Supply Base operational area. They will be regularly serviced and maintained by a licensed contractor to ensure hygiene and sufficient capacity. Waste will be collected and transported by authorised providers to licensed treatment and disposal facilities in line with regulations. Overall wastewater generation is expected to be minimal due to the small workforce and temporary nature of the activity.

## 3.4.2 Discharges and waste

### 3.4.2.1 Offshore activities

Offshore waste and discharge streams are generated primarily from drilling operations, vessel activities, and routine offshore support functions. The largest material streams associated with the drilling programme comprise drilling fluids and cuttings, which are discharged in accordance with the approved programme.

During drilling, approximately 490 tonnes (189 m<sup>3</sup>) of claystone and calcareous rock cuttings are discharged to the seabed during riserless operations, with a further ~453 tonnes (174 m<sup>3</sup>) discharged at 12 m below sea level during riser-based drilling sections. In parallel, water-based drilling muds are reused and recirculated where possible, but still result in discharges of ~1,318 tonnes (1,156 m<sup>3</sup>) to the seabed and ~2,470 tonnes (2,058 m<sup>3</sup>) at a depth of 12 m below sea level over the drilling campaign.

Additional operational discharges include cementing activities, with a worst-case seabed discharge of around 155 tonnes (64.6 m<sup>3</sup>) of cement slurry during cementing of the 20-in casing and up to ~15 m<sup>3</sup> (~28 tonnes) from cleaning and residual surface returns. Bulk material losses are minimal, estimated at less than 0.05 m<sup>3</sup> over the full programme.

Well control and operational systems also contribute minor discharges. Routine testing and maintenance of the blowout preventer (BOP) result in the release of seawater containing up to 4.5% hydraulic fluid (Stack Magic ECO V2). The total campaign discharge is estimated at approximately 42.9 m<sup>3</sup>, of which approximately 1.9 m<sup>3</sup> comprises hydraulic fluid. These discharges occur intermittently.

Contingency operations may generate additional but infrequent discharges, including up to 174 m<sup>3</sup> of cuttings, 48–60 m<sup>3</sup> of cement, and up to 174 m<sup>3</sup> of WBM, depending on operational conditions.

Other offshore waste streams are relatively minor by comparison. Over the 67-day campaign, food waste generated onboard is conservatively estimated at ~189–209 kg per day, resulting in a total of approximately 12.7 tonnes. Municipal solid waste from onboard activities includes approximately 1.2 tonnes of non-recyclable waste, 1.5 tonnes of paper and cardboard, 2.35 tonnes of metals, and smaller quantities of plastics (~56 kg), electronic waste (~375 kg) and used cooking oil (~75 kg).

Hazardous waste is generated in controlled quantities during offshore operations. Typical weekly generation includes approximately 3 m<sup>3</sup> of oily sludge, 480 kg of oil-contaminated waste, 750 kg of chemical waste, and 150 kg of paints and solvents, all of which are stored onboard and transferred to licensed onshore facilities.

### 3.4.2.2 Onshore logistics support and transport base

Onshore waste is limited to activities at the shore base at the Port of Igoumenitsa, where a small workforce of approximately six personnel supports logistics, coordination, and vessel operations. No industrial processing is undertaken at this location.

As a result, waste generation is relatively minor and consists mainly of routine office and welfare-related materials. Municipal waste generation is estimated at approximately 10–12 kg per day, reflecting food packaging, paper products, and general housekeeping waste. The majority of onshore waste is associated with logistics, packaging materials, cargo handling and temporary project support activities rather than routine office occupation.

Non-recyclable general waste is approximately 2.3 tonnes during mobilisation, 5.3 tonnes during operational support, and 2.3 tonnes during demobilisation. Similar scaled quantities apply to other waste streams, including approximately 0.6–1.6 tonnes of paper and cardboard per phase, 0.9–1.7 tonnes of metals, and smaller quantities of food waste (0.22–0.6 tonnes per phase) and plastics (~45–80 kg per phase).

All onshore waste streams are temporarily stored at the shore base and then transferred to licensed waste contractors for recycling, recovery, or disposal in accordance with established port and regulatory systems.

## 3.5 Air emissions

### 3.5.1 Offshore activities

Air emissions associated with the Project will arise primarily from fuel combustion by the Stena DrillMAX drillship, offshore support vessels, helicopter transfers, and a small amount of diesel-powered equipment at the onshore logistics base. The emission profile is therefore dominated by routine operational energy use rather than any process-related releases, as no well testing, flaring, or venting activities are planned.

The drillship is equipped with six IMO Tier I compliant diesel engines and, together with support vessels and limited helicopter operations, represents the main source of atmospheric emissions. Conservative fuel consumption during the 67-day campaign is approximately 2,881 tonnes for the drillship, 1,675 tonnes for support vessels, and 134 tonnes for helicopter operations. These activities generate combustion-related pollutants including nitrogen oxides (NO<sub>x</sub>), sulphur oxides (SO<sub>2</sub>), carbon monoxide (CO), particulate matter (PM<sub>10</sub>), and greenhouse gases.

On a daily basis, total offshore emissions are estimated at approximately 4.9 tonnes of NO<sub>x</sub>, 0.13 tonnes of SO<sub>2</sub>, 0.26 tonnes of CO, and 0.07 tonnes of PM<sub>10</sub>. Over the full campaign duration, this equates to approximately 331 tonnes of NO<sub>x</sub>, 8.4 tonnes of SO<sub>2</sub>, 17.6 tonnes of CO, and 4.9 tonnes of PM<sub>10</sub>. These emissions are short-term in nature and occur offshore under conditions of strong atmospheric dispersion, more than 44 km from the nearest coastline, with low-sulphur marine fuel used in accordance with Mediterranean Emission Control Area requirements.

### 3.5.2 Onshore logistics support and transport base

---

Onshore emissions are associated with the intermittent operation of mobile diesel-powered equipment such as forklifts, cranes, and trucks used within the Port of Igoumenitsa supply base. Given the limited scope of activity and the use of existing port infrastructure, emissions are low and localised, amounting over the campaign to approximately 642 kg of NO<sub>x</sub>, 212 kg of CO, 66 kg of NMVOCs, and 41 kg of particulate matter.

## 3.6 Carbon footprint

### 3.6.1 Offshore activities

---

In terms of greenhouse gas emissions, the Project's carbon footprint is dominated by offshore fuel combustion. Total Scope 1 emissions are conservatively estimated at approximately 15,596 tonnes of CO<sub>2</sub> equivalent over the 67-day campaign. Of this total, the drillship accounts for the majority at around 9,554 tCO<sub>2</sub>e, or 61.3%, followed by support vessels at approximately 5,555 tCO<sub>2</sub>e, or 35.6%, while helicopter operations contribute about 426 tCO<sub>2</sub>e, or 2.7%. Onshore activities represent a marginal contribution of approximately 62 tCO<sub>2</sub>e or less than 0.4%.

Carbon dioxide is the principal greenhouse gas emitted, with smaller contributions from methane and nitrous oxide, both arising from fuel combustion. Overall, emissions are consistent with those expected from a short-duration offshore drilling campaign, in which energy demand for marine propulsion and power generation is the primary driver of the environmental load.

Given the temporary 67-day duration, the offshore location and the absence of production testing or flaring, greenhouse gas emissions are primarily associated with fuel combustion for drilling, marine transport, and power generation. The overall carbon footprint reflects the inherently energy-intensive nature of offshore drilling activities rather than any abnormal or process-specific emission source.

### 3.6.2 Onshore logistics support and transport base

---

The onshore carbon footprint arises primarily from the use of small-scale diesel-powered mobile equipment such as forklifts, cranes, trucks, and other handling vehicles used intermittently for loading, unloading, and transferring materials and waste.

Fuel consumption associated with these activities is relatively low, reflecting the limited scope of operations and short duration of use. Total onshore fuel use is estimated at approximately 19.7 tonnes of diesel over the campaign, resulting in direct greenhouse gas emissions of around 62 tCO<sub>2</sub>e (Scope 1).

These emissions are minor when compared with offshore activities and represent only a small fraction of the overall Project carbon footprint. They are temporary in nature and confined to an existing industrial port setting, where similar emissions are already present from routine port operations and vessel activity.

## 3.7 Noise and vibration emissions

### 3.7.1 Offshore activities

Underwater and airborne noise associated with the Project will arise from offshore drilling activities, vessel operations, helicopter movements, and limited subsea activities. The assessment focuses on Project-related anthropogenic noise sources that may affect marine fauna through disturbance, masking, behavioural responses, or, in extreme cases, injury.

Airborne noise from a vessel is generated primarily by machinery onboard the drillship and support vessels, including engines, generators, pumps, and deck equipment. However, because the drillship will operate at least 44 km offshore, airborne noise at shore is expected to attenuate completely before reaching sensitive receptors. As a result, no significant onshore airborne noise impacts are anticipated.

Helicopter operations (using an AW139 or equivalent) will occur intermittently for crew changes and logistics support. Although helicopters generate short-duration noise from their engines and rotor systems, flights are infrequent and brief, and where possible, follow defined offshore routes. Given the offshore location and limited operational frequency, helicopter noise is also not expected to have perceptible impacts on onshore receptors.

Sound from offshore operations propagates through water as pressure waves and is measured in dB re 1  $\mu$ Pa, using metrics such as peak pressure, RMS levels, and frequency content. Continuous noise sources dominate most offshore environments, particularly in the low-frequency range, where shipping and large vessels are prevalent.

With regard to non-impulsive underwater noise, the dominant continuous underwater noise sources are the drillship and support vessels, primarily due to propulsion systems, thrusters, and propeller cavitation. Noise levels increase with vessel size, speed, and loading conditions. Representative source levels are ~195 dB re 1  $\mu$ Pa @ 1 m for the drillship and ~180–190 dB re 1  $\mu$ Pa @ 1 m for the support vessels.

These sounds are low frequency in nature and attenuate with distance from the source. In deep offshore conditions such as the Project area, sound propagation is expected to decrease significantly with distance due to free-field spreading and limited boundary reflections.

Additional non-impulsive contributions arise from:

- Helicopter overflights (minor underwater coupling only)
- ROV operations during inspection and subsea support (low-intensity, highly localised)

Impulsive underwater noise will occur only during Vertical Seismic Profiling (VSP) activities conducted during the formation evaluation process with wireline. VSP involves a small airgun array deployed near the sea surface, with a total source volume of approximately 1,000 in<sup>3</sup> and a limited number of shots (up to ~260 shots over short operational periods of ~12 hours).

The VSP source is designed to acquire geological information beneath the seabed and is substantially smaller than conventional seismic survey sources, resulting in a more limited spatial footprint and shorter duration of acoustic exposure.

To minimise potential disturbance to marine fauna, standard mitigation measures will be implemented, including soft-start procedures and, where practicable, visual monitoring for marine mammals before source activation. These measures are implemented in line with relevant Greek and EU regulatory requirements and regional best practice guidance.

In summary, underwater noise from the Project is dominated by continuous vessel and drilling-related sources, with a short-duration impulsive component limited to VSP operations. Airborne noise effects are negligible at shore due to the offshore location and rapid attenuation over distance.

Given the temporary nature of the drilling campaign, the offshore location, and the limited duration of VSP activities, mitigation measures such as operational controls, soft-start procedures, and compliance with applicable environmental protection requirements will further reduce the potential for disturbance to sensitive marine species.

### 3.7.2 Onshore logistics support and transport base

---

Noise emissions at the shore base are similarly limited and are associated to the intermittent operation of mobile equipment, including forklifts, trucks, cranes, and auxiliary machinery used for cargo handling and storage.

Noise is expected to be typical of standard port operations, consisting mainly of short-duration, low-frequency mechanical noise associated with engine use, lifting operations, and vehicle movements. Because activities will take place within an established port area, these sound sources will be absorbed into the existing industrial noise environment.

The temporary nature of operations, combined with the limited number of personnel (approximately six workers) and the absence of heavy construction or continuous industrial activity, means that noise generation will be intermittent rather than continuous. Any potential disturbance will therefore be localised within the port boundary and will not extend to surrounding residential receptors at significant levels.

## 3.8 Electromagnetic radiation and radioactivity emissions

---

Radioactive materials are not routinely used or stored on board the Stena DrillMAX, except for sealed radioactive sources that may be temporarily deployed during downhole logging operations for geological formation evaluation. Typical sources include americium-beryllium (Am-241/Be) and caesium-137 (Cs-137).

These sources are fully encapsulated within specialised tools, used only temporarily during drilling, and are always retrieved back to the surface after each operation, with no discharge or release to the marine environment. Their use is strictly controlled under licences issued by the Greek Atomic Energy Commission (EEAE) and regulated in accordance with EU radiation safety legislation (Euratom Directive 2013/59).

Accumulation of naturally occurring radioactive material (NORM) is not expected, as the Project includes a temporary exploration well and does not involve hydrocarbon production or processing.

Overall, radiological sources are used only intermittently, remain fully contained within engineered systems, and are managed under strict regulatory control.

## 4 Project rationale and objectives

### 4.1 Energy security

The Project is undertaken within a broader national and European energy-security framework (see Section 5.3.4 on the Legislative Framework for Energy Security), where the reliability, resilience, and diversification of energy supply have become increasingly important considerations for Greece, Italy, and the European Union (EU) under Article 194 of the Treaty on the Functioning of the European Union (TFEU) and Regulation (EU) 2017/1938 concerning measures to safeguard the security of gas supply. Strengthening understanding of domestic and regional resource potential supports informed long-term energy planning. It contributes to reducing exposure to supply disruptions originating outside the European energy system, as supported by the European Energy Security Strategy (2014) and the REPowerEU Plan (2022).

For Greece, offshore exploration in Block 2 represents a strategic opportunity to responsibly assess indigenous offshore resource potential using newly verified geological data from exploration drilling. The Project supports evidence-based decision-making by reducing subsurface uncertainty through measured data, thereby enabling realistic assessments of the role that domestic resources could play in Greece's future energy mix, subject to regulatory and policy frameworks. By assessing domestic resources, the Project could contribute to informing the national strategy, as described within Law 4001/2011 on the Operation of Energy Markets and Hydrocarbon Regulation and the National Energy and Climate Plan (NECP), including efforts to manage dependency on long-distance, higher-carbon-footprint energy imports and to strengthen the resilience of the Greek energy system during its transition to a renewables-based future, without pre-judging future policy decisions on hydrocarbon development.

The structure has been identified as potentially hydrocarbon-bearing, based on seismic interpretation. However, confirmation requires exploration drilling, as described in the following sections. If hydrocarbons are discovered, the results may inform future assessments of domestic energy resource potential, subject to subsequent appraisal, development decisions and regulatory approvals.

The geographic location of Block 2 in the north-western Ionian Sea, adjacent to the maritime boundary between Greece and Italy, places the Project within a broader regional energy context. In this setting, exploration activities contribute to improved geological understanding that may support coordinated energy planning between neighbouring EU Member States, consistent with the principles of cross-border cooperation, security of supply, and integrated European energy markets, clearly defined in the EU Maritime Spatial Planning Directive 2014/89/EU.

At the EU level, the Project aligns with broader objectives to enhance energy system resilience by improving knowledge of indigenous resource potential within European waters. While the Project itself is exploratory and does not pre-empt field development, the data generated may, if resources are confirmed, inform future discussions on supply diversification, regional infrastructure connectivity, and long-term energy security within the European Union.

Block 2 is characterised by a relatively high level of technical maturity, supported by modern seismic datasets and a clearly defined drilling target, recognising that key reservoir parameters and hydrocarbon presence remain uncertain prior to drilling. The proposed exploration well represents a milestone, as it marks

the resumption of offshore exploratory drilling investment in Greece after four decades, undertaken in accordance with contemporary technical, safety, and environmental standards.

A consortium of experienced national and international companies with established offshore expertise implements the Project. The partnership brings world-class deepwater expertise and confirms international confidence in Greece's energy sector. The Project will also result in the transfer of relevant high-resolution geological and environmental data to HEREMA, in accordance with applicable legal and contractual provisions, creating a long-term national scientific resource for basin evaluation and research.

The Project has been designed to comply with applicable Greek legislation, European Union requirements and relevant industry standards. Implementation of Project activities will remain subject to the conditions of all required permits, approvals and regulatory authorisations.

#### 4.1.1 Rationale and objectives from project implementation

---

The purpose of the Project is to evaluate the hydrocarbon potential of the Asopus prospect within Block 2, through the drilling of one offshore exploration well and associated activities. The Project is intended to test a large, well-defined subsurface structure identified through extensive geological and geophysical studies, including the acquisition and interpretation of modern 3D seismic data. The Project targets the Asopus structure, which covers approximately 1,000 km<sup>2</sup> and represents the first offshore exploration well in Western Greece since 1981, when the West Katakolo Field was discovered. More broadly, it will be the first exploratory drilling activity in Greece since the onshore Epanomi-1 well was drilled in 1986. While the prospect is technically mature, the drilling involves geological uncertainty typical of frontier deepwater exploration. The Asopus-1 exploration well is expected to primarily target a reservoir for which internal pre-drill volumetric assessments indicate a mean-case gas-in-place estimate of approximately 270 billion cubic metres, under a range of geological assumptions.

##### 4.1.1.1 Project rationale

---

The implementation of the proposed Asopus-1 exploration well is designed to evaluate the presence, nature, and properties of potential hydrocarbons within a previously undrilled geological play. While existing data indicate favourable subsurface conditions, exploration drilling is required to reduce geological uncertainty and to obtain direct information on reservoir characteristics, fluids, and pressures.

The Asopus prospect is the most technically mature and clearly defined undrilled structure in Block 2. Although seismic and geological data suggest favourable subsurface conditions, the prospect remains untested and is subject to the uncertainties typical of deepwater exploration in a previously undrilled area of the Ionian Sea. Internal volumetric assessments suggest the structure may contain potentially material volumes of hydrocarbons under various geological scenarios. Petroleum system analysis indicates the presence of essential elements for hydrocarbon accumulation, such as mature source rocks, viable migration pathways, and effective traps within Block 2. However, the presence, phase, and recoverability of any hydrocarbons can only be confirmed through exploration drilling.

The proposed well represents the next step in the phased exploration strategy for Block 2. The information generated through the Project will contribute to an improved understanding of domestic energy resource potential, supporting long-term energy security planning at national and regional levels. Results from drilling will be used to refine the geological model and inform any future appraisal or exploration decisions, which would be subject to separate technical evaluations, environmental assessments, and regulatory approvals. This ESIA only addresses the environmental assessment of the Asopus-1 drilling operation; any subsequent appraisal or development activities would be subject to separate environmental assessment and permitting in accordance with Greek and EU law.

All relevant data acquired will be shared with the Hellenic Hydrocarbon and Energy Resources Management Company (HEREMA), in line with applicable Greek legislation, Lease terms and regulatory guidance, to enhance the national geological database.

The Project forms part of Energean's, together with its co-venturers', contractual obligations under the Block 2 Lease Agreement. The proposed activities are exploratory in nature and do not constitute a commitment to field development or hydrocarbon production. Any subsequent appraisal or development phase would be subject to separate technical studies, environmental assessments, and regulatory approvals.

#### 4.1.1.2 Project objectives

The primary objective of the Project is to safely and responsibly evaluate the hydrocarbon potential of the Asopus prospect by drilling one offshore exploration well, while ensuring full compliance with all environmental, safety, and regulatory requirements.

##### 4.1.1.2.1 Technical and operational objectives

The main technical and operational objectives of the exploration drilling campaign are to:

- Drill a single offshore exploration well (Asopus-1) targeting the Asopus prospect within Block 2, using a modern deepwater drilling unit and applying international good industry practice as a non-binding benchmark, while operating in accordance with applicable environmental, safety and regulatory requirements.
- Evaluate the main Asopus reservoir interval to evaluate reservoir presence, assess hydrocarbon type (if present), and acquire key petrophysical and pressure data.
- Evaluate the Top Cretaceous interval as a secondary, higher-risk exploration objective, subject to geological conditions encountered during drilling.
- Assess the effectiveness of the petroleum system within Block 2 by integrating well results with existing seismic and geological data, thereby reducing geological, volumetric, and play-level uncertainties.
- Acquire high-quality subsurface data that cannot be obtained through geophysical methods alone, including well logs, samples, and pressure measurements, to support future basin evaluation and inform any potential future exploration or appraisal decisions within Block 2.
- Provide all geological, geophysical, and environmental data required under applicable Greek legislation,

lease terms, and regulatory guidance to the Hellenic Hydrocarbon and Energy Resources Management Company (HEREMA), in accordance with its statutory mandate under Law 4409/2016, thereby contributing to the national offshore geological database.

#### 4.1.1.2.2 Environmental and execution objectives

Alongside its technical objectives, the Project is framed to ensure that exploration activities are conducted with sound environmental protection and operational control practices, in line with regulatory requirements. The main environmental and execution objectives include:

- Conducting all Project activities in full compliance with Greek legislation, European Union requirements, and applicable international standards for offshore exploration (see Chapter 5).
- Applying the mitigation hierarchy and precautionary principle through careful planning, use of best available techniques (BAT) and best environmental practice (BEP), and implementation of dedicated environmental monitoring programmes as described in this ESIA
- Implementing and maintaining robust well integrity, emergency preparedness, and oil spill prevention and response capability appropriate to deepwater operations.
- Protecting sensitive marine receptors through the application of mitigation and monitoring measures described in this ESIA, including measures related to underwater noise and marine biodiversity and associated reporting to competent authorities.

#### 4.1.1.2.3 Long-term knowledge objectives

Irrespective of the outcome of the exploration well, the Project is expected to deliver long-term value by generating geological, environmental, and operational knowledge. The Project will:

- Enhance understanding of the geological evolution and hydrocarbon potential of the Ionian Sea basin.
- Generate environmental baseline data that support marine scientific research, marine spatial planning, and future environmental assessments, and that will be made available to competent authorities and, where appropriate, the scientific community.
- Contribute to national institutional and technical capacity by applying contemporary offshore technical, safety, and environmental standards within the Greek regulatory framework.

These objectives support informed, evidence-based decision-making regarding Greece's offshore resource potential, without pre-judging future exploration, appraisal, or development outcomes.

### 4.1.2 Feasibility

Project feasibility has been assessed using available geological, geophysical, technical, operational, environmental, and logistical data. Although some key parameters for the Asopus prospect require confirmation through exploration drilling, current datasets provide a sound technical and operational basis for drilling an offshore exploration well in Block 2, offshore Greece.

The feasibility assessment does not assume or require further appraisal or development.

#### 4.1.2.1 Geological and subsurface

---

Geological feasibility is supported by extensive pre-drill technical studies by Energean and its co-venturers. These include detailed seismic interpretation, structural mapping, and petroleum system analysis using modern 3D seismic data from Block 2.

The Asopus prospect is a large, well-defined geological structure with clear seismic expression and a well-understood regional-scale trapping configuration. Seismic data indicate laterally continuous stratigraphic intervals at the target reservoir level, with structural closure sufficient to retain hydrocarbons, if present. Petroleum system analysis indicates favourable conditions for hydrocarbon generation and charge within the wider Ionian Sea basin, including:

- the presence and maturity of source rocks at depth,
- viable migration pathways, and
- effective trapping and sealing configurations.

Internal pre-drill volumetric assessments, based on geological interpretation, seismic data, and analogues from offset wells in the Adriatic and Ionian region, indicate potential for hydrocarbons of material scale across various geological scenarios. However, key uncertainties regarding reservoir presence, quality, fluid type, and pressure regime can only be resolved through exploration drilling.

Therefore, drilling the Asopus-1 exploration well is technically feasible and is the appropriate next step to reduce geological uncertainty and validate subsurface interpretations.

#### 4.1.2.2 Technical and operational

---

The Project is technically feasible with existing offshore drilling technology and proven operational solutions. Using a modern deepwater drilling unit is suitable for the expected water depth and subsurface conditions, enabling safe and controlled execution of the exploration well.

The well design, drilling programme, and marine operations comply with Greek and EU regulatory requirements, with international good industry practice serving as a supplementary, non-binding benchmark. The Project's limited duration and single-well scope further enhance operational feasibility by reducing cumulative risk and complexity.

Support activities, including marine logistics, aviation, and shore base operations, will utilise existing infrastructure and established service providers, ensuring that no permanent facilities are required. Similar offshore operations have been successfully executed by Energean and other operators in comparable deepwater environments within the Eastern Mediterranean.

#### 4.1.2.3 Environmental and regulatory

---

Environmental feasibility has been assessed by identifying potential impacts, applying the mitigation hierarchy, and incorporating best available techniques and best environmental practice into the project design. The Project is specifically designed to minimise environmental disturbance by:

- limiting activities to a single well location with no well testing,
- restricting the duration of offshore operations,
- avoiding the installation of permanent infrastructure, where practicable, and
- implementing mitigation and monitoring measures for sensitive marine receptors.

Where residual impacts are predicted, they are expected, based on the current assessment, to be limited in extent, short-term in duration, and generally reversible, as described in the impact assessment chapters of this ESIA, subject to the implementation and effectiveness of the proposed mitigation and monitoring measures.

The regulatory framework governing offshore exploration in Greece is well established and implements EU legislation, including provisions on environmental assessment, offshore safety, and emergency preparedness. The Project can be executed in conformity with this framework, subject to the permits and approvals described in this ESIA and to any additional conditions or regulatory requirements that the competent authorities may impose.

Environmental baseline data collected for the Project, along with additional monitoring during execution, further support environmental feasibility by enabling adaptive management and regulatory oversight.

#### 4.1.2.4 Economic and financial

---

The exploration well is a privately funded investment, with all geological, technical, and financial risks assumed by Energean and its co-venturers. The Project does not create any financial obligation for the Greek State.

No commercial development assumptions are required to establish exploration feasibility. Internal screening-level economic evaluations indicate that the proposed activity is an appropriate allocation of exploration capital within Energean's portfolio and is consistent with its risk management and investment decision processes. Any future appraisal or development, if hydrocarbons are discovered, would be subject to separate technical, economic, environmental, and regulatory evaluations.

#### 4.1.2.5 Conclusions

---

Considering geological, technical, operational, environmental, regulatory, and financial factors, the Project is feasible as a limited-duration offshore exploration activity. Existing subsurface data indicate favourable conditions for exploration drilling, while acknowledging inherent uncertainties prior to drilling. The proposed well can be executed safely and responsibly using established technologies, within the regulatory framework, and with manageable environmental impacts as assessed in this ESIA.

The Project is a feasible and proportionate way to advance understanding of the offshore resource potential in Block 2, consistent with national regulatory requirements and international standards for offshore exploration.

### 4.1.3 Expected benefits on local, regional and national levels

---

The Project is an offshore exploration activity and, as such, is limited in duration and spatial extent. While it does not involve production or long-term infrastructure, the exploration phase provides several environmental, economic, and social benefits, primarily through information generation, capacity building, and the application of modern standards and practices.

#### 4.1.3.1 Energy diversification and sustainable development

---

Exploration activities in Block 2 contribute to improved understanding of offshore geological potential, enabling more informed planning regarding energy diversification and sustainable energy system development. By generating verified subsurface data, the Project supports evidence-based decision-making concerning the potential role of domestic resources in Greece's long-term energy transition, without predetermining whether any future hydrocarbon development will proceed (Section 5.3.4 Legislative Framework for Energy Security).

The Project is consistent with the various principles of sustainable development by applying modern offshore technologies and good international industry practices to minimise environmental disturbance while generating information that may inform future policy and planning decisions. The exploration phase does not commit Greece to hydrocarbon development but provides the factual basis required to assess potential options in a structured and responsible manner.

Environmental protection is embedded in Project design and execution through the application of best available techniques (BAT), best environmental practice (BEP), and precautionary management approaches, ensuring that potential environmental effects are identified, mitigated, and monitored in accordance with national and EU requirements (Section 5.4)

#### 4.1.3.2 Economic and community benefits

---

Exploration activities associated with the Project may generate short-term economic benefits through the procurement of services, the use of specialised offshore logistics, and support activities linked to drilling operations, commensurate with the single-well, campaign-based nature of the Project. While offshore exploration relies on highly specialised international contractors, opportunities may arise for local and regional service providers, subject to technical suitability and availability. The exploration well represents a private investment of approximately €70–€80 million (Section 4.5). All financial and geological risks are borne by the Project proponents, with no capital risk to the Greek State or the public.

The Project may also have indirect benefits by reinforcing Greece's position as an active and credible offshore operator jurisdiction that applies contemporary technical, safety, and environmental standards. This

can contribute to longer-term confidence in the regulatory and operational framework governing offshore activities.

Energean anticipates that approximately €12 million in Project expenditure could be directed toward the national and local economy through increased activity in logistics, transportation, and supplies, and through the use of existing infrastructure and the development and application of specialised technical know-how, subject to contractor selection, operational performance, and market conditions. Energean and its co-venturers will carry out proportionate and timely engagement with affected and interested stakeholders, in line with EU requirements on access to environmental information and public participation in environmental decision-making (including the Aarhus Convention, as implemented in EU law). This includes engagement with relevant local professional, academic and business organisations, such as the Technical Chamber, Commercial Chamber, Ionian University and hotel associations, as well as other stakeholders identified through the permitting process. Energean will maintain clear and transparent stakeholder communication throughout the permitting and exploration process, consistent with applicable EU and national requirements relating to environmental information, consultation and stakeholder engagement.

In the event of a commercial discovery and subsequent appraisal and development, any potential fiscal revenues would be determined by the applicable profit-sharing regime and prevailing market conditions, and would be subject to separate economic, regulatory and environmental assessments.

#### 4.1.3.3 Employment benefits

---

Employment benefits associated with the exploration phase of the Project are primarily related to onshore and near-shore support activities, including logistics, port operations, aviation services, accommodation, catering, transportation, and other ancillary services required to support offshore drilling operations.

The Project will require the use of an established shore base, port facilities, and air transport services, including personnel movements via Corfu International Airport, as well as accommodation and hospitality services in the wider regional area. These activities are expected to generate temporary demand for goods and services and provide business opportunities for local and regional service providers.

As a significant portion of offshore exploration activities are anticipated to take place outside the peak tourism season, Project-related demand for accommodation, transport, and related services may provide supplementary economic activity for local businesses during periods when tourism-related demand is generally lower. This may help support business continuity and employment in sectors that experience seasonal fluctuations.

The specialised nature of offshore drilling operations requires personnel with specific technical qualifications, offshore certifications, and operational experience. Consequently, a substantial proportion of the offshore workforce is expected to be sourced through experienced drilling and service contractors. Nevertheless, opportunities may arise to engage national personnel in shore-based, aviation, logistics, and support roles, subject to technical requirements and availability.

Where technically feasible and commercially competitive, the Project will seek to utilise qualified national suppliers and service providers in accordance with applicable procurement procedures and Project

requirements. To support local participation, the Project proponents intend to conduct supplier engagement activities, including workshops and information sessions aimed at increasing awareness of the technical, safety, environmental, quality and other relevant compliance standards required for participation in the offshore support supply chain.

Employment benefits associated with the Project are expected to be temporary and project-specific, proportionate to the limited duration of the exploration campaign. These benefits are anticipated to arise primarily through indirect economic effects associated with the procurement of goods and services and demand for support activities during the exploration period. They are not anticipated to result in structural changes to regional employment patterns.

All port and aviation activities will be conducted in accordance with applicable Hellenic Coast Guard and Civil Aviation Authority requirements.

#### 4.1.3.4 Knowledge and capacity building benefits

---

Irrespective of the outcome of the exploration well, the Project will generate valuable geological, geophysical, environmental, and operational data that will enhance understanding of the Ionian Sea basin (Section 4.1.1). This information contributes to Greece's offshore knowledge base and supports future basin evaluation, marine spatial planning, and scientific research initiatives. The data-sharing initiative will specifically target biological and acoustic observations of cetacean populations in the Ionian Sea (see Chapter 8 – Environmental baseline status), contributing high-resolution scientific baseline data critical to the long-term conservation of the Hellenic Trench ecosystem.

In addition, the Project is being undertaken in the context of renewed offshore exploration activity in Greece, involving multiple international operators that employ contemporary offshore technologies, adhere to regulatory processes, and meet environmental management standards. This broader offshore activity contributes to knowledge accumulation and capacity building across national institutions, service providers, and regulatory bodies.

Exposure to a range of good international industry practices supports the continued development of:

- Offshore regulatory oversight and permitting processes.
- Environmental monitoring and impact assessment methodologies.
- Emergency preparedness and response planning.
- Port, aviation, and logistics capabilities supporting offshore operations.

The combination of Project-specific experience and broader offshore activity strengthens institutional learning and technical capacity within Greece, independent of exploration outcomes. This enhances the country's ability to manage offshore activities in a structured, transparent, and environmentally responsible manner over the long term.

## 4.2 Hydrocarbon exploration well projects - brief overview

Since 2009, Energean has established demonstrable offshore well operator credentials through the planning and execution of multiple offshore drilling campaigns with drillships and jack-up rigs in the North Aegean Sea, Eastern Mediterranean and North Africa. These campaigns covered exploration, appraisal, and development wells in shallow-water, deepwater, and ultra-deepwater environments, and were conducted in accordance with prevailing safety, environmental and regulatory standards. This operating track record provides a robust basis for the proposed Asopus-1 offshore exploration well in Block 2.

This experience demonstrates Energean's ability to plan, manage and execute offshore drilling activities safely and efficiently. Core competencies include drillship selection and contracting, well design, drilling operations, marine and aviation logistics, contractor coordination, regulatory engagement and post-well close-out.

### 4.2.1 Background - international experience in exploration well projects

Energean has conducted multiple offshore well operations with drillships across several jurisdictions, including four wells in Israel in 2019, six in 2022, two in 2026, and an appraisal well in Morocco in 2024.

Collectively, these activities demonstrate Energean's established experience in offshore operations with drillships, encompassing exploration, appraisal, and development wells, delivered with a consistent emphasis on safety, environmental management and regulatory compliance. This operating history supports the conclusion that the proposed Asopus-1 exploration well will be managed by an operator with proven deepwater offshore drilling capability.

#### 4.2.1.1 Operated offshore drilling experience - Israel

Energean has completed multiple offshore drilling campaigns in Israel, using modern drillships in deepwater environments under the oversight of the Israeli Ministry of Energy and Infrastructure. These campaigns represent the most directly relevant precedent for the Asopus-1 Project with respect to offshore operational complexity and regulatory requirements.

In 2019, Energean deployed the Stena DrillMAX drillship to drill three development wells and one exploration well, resulting in the discovery of the Karish North field. The campaign was completed safely and in full compliance with applicable regulatory and environmental requirements, demonstrating Energean's capabilities in offshore drilling operations, environmental management, marine logistics and contractor coordination in the Eastern Mediterranean.

In 2022, Energean executed a further offshore drilling campaign using the Stena IceMAX drillship. This six-well campaign comprised development, appraisal and exploration activities, including:

- one development well, involving the reentry, sidetrack and completion of the previously drilled Karish North well;
- one appraisal well (Karish Main-04);
- and four exploration wells across multiple license areas offshore Israel that resulted in the discovery of

the Katlan field.

The 2022 campaign required extended drillship mobilisation, coordination of multiple campaign objectives and engagement with several regulatory authorities. It was executed using Energean's established health, safety and environmental management systems, further demonstrating the company's ability to manage complex, multi-well offshore drilling campaigns safely and consistently across different license areas.

In 2026, Energean is conducting a two-well development drilling campaign offshore Israel as part of the Katlan field development, utilising the Saipem Santorini drillship, further reinforcing its ongoing operational presence and experience in the region.

Taken together, the 2019, 2022, and 2026 Israeli offshore drilling campaigns demonstrate Energean's consistent, operator-led offshore drilling capability, including the safe execution of development, appraisal and exploration wells using different drillships, and the effective management of environmental and safety risks in deepwater offshore settings.

#### 4.2.1.2 Operated offshore drilling experience – Morocco

---

Energean has also acted as operator of offshore licences in Morocco, extending its offshore drilling activities into a different regulatory and operational environment. In 2024, Energean drilled one offshore appraisal well using the Stena Forth drillship. This activity demonstrates Energean's ability to safely mobilise and operate a drillship, manage offshore logistics and contractors, engage with regulatory authorities and execute drilling operations in accordance with approvals and international safety and environmental standards in a non-core jurisdiction.

#### 4.2.1.3 Operated offshore drilling experience – Greece

---

Energean has a long operational history in Greece through the Prinos offshore development, located in the North Aegean Sea near Kavala. Activities have included offshore drilling operations, well interventions, logistics coordination, marine support, and environmental management. To date, Energean has drilled three wells and conducted seventeen well intervention campaigns at Prinos, maintaining an excellent HSE performance record in line with its HSE and environmental management systems and applicable Greek and EU regulatory requirements, while carrying out safe activities adjacent to areas with extensive tourist and fishing activity. This experience demonstrates familiarity with Greek and EU regulatory requirements, offshore operations in Greek waters, and the management of drilling, intervention, and associated environmental risks through established HSE and environmental management systems.

#### 4.2.1.4 Non-operated offshore exploration experience

---

In addition to its operated activities, Energean has participated as a non-operating partner in offshore exploration wells led by international oil and gas companies. This includes participation in the Orion-1X offshore exploration well in Egypt, operated by a subsidiary partly owned by Eni, and involvement as a

joint-venture partner in the Isabella offshore exploration and appraisal programme in the UK Continental Shelf, operated by a TotalEnergies subsidiary.

Although Energean was not the designated operator for these wells, its role involved subsurface evaluation, well planning, drilling programme review, regulatory engagement and post-well technical assessment within established joint-venture governance structures. These activities complement Energean's operated drilling record by demonstrating offshore exploration experience both as an operator and an active technical partner.

## 4.2.2 Progress of exploration well projects in Europe

This section describes the regional and European context for offshore exploration activity relevant to the proposed Asopus-1 well. Oil and gas exploration in Europe during 2025–2026 remains limited, with drilling concentrated in a few jurisdictions and increasingly focused on natural gas. Exploration levels are low relative to historical trends and other global regions, reflecting basin maturity, regulatory and fiscal pressures, and policy frameworks that prioritise decarbonisation, as well as a broader shift by operators towards lower-risk, infrastructure-led projects (<https://www.iea.org/reports/world-energy-outlook-2024>).

Since 2022, European energy policy and market assessments have adjusted in response to increased energy security concerns and the need to reduce reliance on external gas supplies.

Disruptions in international energy markets have highlighted the importance of supply diversification and the development of domestic resources. Within this context, domestic oil and gas, particularly natural gas, are often treated in policy and industry assessments as transitional components for short- to medium-term supply security, alongside long-term commitments to emissions reduction and energy transition objectives ([https://commission.europa.eu/publications/repowereu-plan\\_en](https://commission.europa.eu/publications/repowereu-plan_en)).

This evolving policy context has not resulted in a broad recovery in exploration activity across Europe. Instead, it has reinforced a selective investment environment, with capital directed toward gas-focused prospects, near-field opportunities, and projects capable of utilising existing or planned infrastructure. Industry analyses indicate a continued preference for incremental exploration and appraisal over frontier or basin-opening drilling, with project viability strongly influenced by environmental sensitivities, regulatory expectations, and access to infrastructure (<https://www.iea.org/reports/world-energy-outlook-2024>).

Norway remains the main centre of exploration activity in Europe and is the only jurisdiction where offshore exploration drilling continues at a sustained scale.

This position is supported by a stable fiscal regime, predictable licensing through annual APA (Awards in Predefined Areas) rounds, and extensive offshore infrastructure. According to the Norwegian Offshore Directorate<sup>9</sup>, 49 exploration wells were completed on the Norwegian continental shelf in 2025 (), with operators' plans indicating a slightly lower, but still relatively high, level of exploration drilling in 2026. Activity is dominated by gas-prone plays, near-field prospects, and subsea tie-back developments, with a smaller number of higher-risk frontier exploration wells in less mature offshore areas (<https://www.sodir.no/en/>).

<sup>9</sup> <https://www.sodir.no/en/facts/data-and-analyses/exploration-wells-statistics/>

**Figure 4-1: Completed exploration wells on the Norwegian continental shelf since 2000 (Source: Norwegian Offshore Directorate)**

**Figure 4-1: Completed exploration wells on the Norwegian continental shelf since 2000 (Source: Norwegian Offshore Directorate)**

In contrast, exploration on the United Kingdom Continental Shelf has declined to historically low levels. Publicly available UK regulatory and industry data indicate that no new offshore exploration wells were spudded on the UK Continental Shelf in 2025, marking the first year in several decades without new exploration drilling. Remaining activity is largely limited to development and infrastructure-led opportunities, while upstream investment is at historically low levels and operator focus has shifted toward late-life asset management and decommissioning (<https://www.nstauthority.co.uk/>).

Across other European Union Member States, offshore exploration activity remains limited and geographically dispersed, reflecting basin maturity, increasingly stringent environmental and permitting requirements, and national policy choices turning towards renewable energy sources (Figure 4-2) (<https://www.eea.europa.eu/>). In north-western and central Europe, including the Netherlands, Denmark, and Germany, exploration is minimal and typically limited to small-scale, gas-focused opportunities tied to existing infrastructure in mature basins. In some cases, such as Denmark, policy decisions have resulted in restrictions on or prohibitions of new oil and gas exploration. In contrast, in other jurisdictions, onshore exploration is heavily restricted, and limited offshore gas-focused activity remains possible under strict environmental conditions.

**Figure 4-2: Progress towards renewable energy source targets for EU-27 (Source: Eurostat<sup>10</sup> & European Environment Agency (EEA)<sup>11</sup>)**

In southern European EU waters, offshore exploration drilling has continued on a highly selective basis under established regulatory frameworks and EU environmental legislation. This includes the Gemini-1 exploration well drilled by Eni in the Italian offshore sector of the Strait of Sicily, within Italy's Exclusive Economic Zone. Gemini-1 formed part of a broader, infrastructure-led exploration programme in the Ibleo area and was undertaken following an Environmental Impact Assessment carried out under Italian and EU legislation. The project is consistent with broader European patterns observed in recent offshore exploration, characterised by limited, gas-focused activity near existing infrastructure, with drilling results informing appraisal or development decisions subject to separate assessment and permitting (<https://www.eni.com/en-IT/media/press-release/2025/01/enilive-begins-saf-production-at-its-plant-in-gela.html>). Offshore

exploration and appraisal activity has also taken place in Cyprus, where projects are subject to EU environmental legislation and national permitting requirements; recent activity in Cypriot waters has largely transitioned from discovery drilling toward appraisal and development planning (<https://www.meci.gov.cy>).

Greece represents an emerging upstream province within this regional and European context. Following extensive seismic acquisition and interpretation, offshore areas in the Ionian Sea, including the north-western Ionian offshore area, as well as other Ionian concessions held by international and Greek joint ventures, have progressed through successive stages of technical evaluation and are, subject to regulatory

<sup>10</sup> [https://ec.europa.eu/eurostat/databrowser/view/NRG\\_IND\\_REN/default/table?lang=en](https://ec.europa.eu/eurostat/databrowser/view/NRG_IND_REN/default/table?lang=en)

<sup>11</sup> <https://www.eea.europa.eu/en/datahub/datahubitem-view/1fd08152-1371-4274-8091-b50467738376>

approval under Greek and EU law, approaching a stage at which exploration drilling may be considered. In parallel, offshore blocks south of Crete have been leased to consortia involving international oil companies and Greek partners, which are advancing multi-phase exploration programmes aimed at assessing deepwater gas potential (<https://www.hhrm.gr>).

In Eastern Europe, the Black Sea has become an important area for offshore gas exploration and development and is increasingly discussed in the context of European energy supply diversification. In Romania, offshore drilling continues as part of the Neptun Deep project, which includes multiple development wells and associated infrastructure, with additional drilling planned prior to first gas later in the decade that according to the Consilium Policy Advisors Group summary report<sup>12</sup> is expected to have significant economic impacts on the Romanian economy as presented in Figure 4-3.

Exploration and appraisal activity is also ongoing in Bulgaria's Han Asparuh licence area. In the Turkish sector of the Black Sea, offshore exploration and appraisal activity has continued following recent gas discoveries, with a current focus on development of known accumulations and optimisation of existing and planned infrastructure (<https://www.omvpetrom.com>, <https://www.me.government.bg>).

Figure 4-3: Neptune Deep expected economic impacts (Source: OMV Petrom website)

In the Eastern Mediterranean outside the European Union, offshore activity has largely evolved toward appraisal and development of existing gas discoveries. In Israel and Egypt, recent activity has focused on progressing discovered resources toward development, including offshore infrastructure planning and phased appraisal programmes (<https://www.iea.org/reports/gas-market-report-q2-2024>). These activities take place within complex regulatory, geopolitical, and environmental contexts and are subject to project-specific environmental assessment processes.

<sup>12</sup> <https://www.omvpetrom.com/downloads/2025/07/b8f93625-3b21-701a-660d-dd6e784f6427/CPAG%20impact%20study%20summary.pdf>

Overall, oil and gas exploration activity in Europe remains limited, selective, and unevenly distributed. Most current activity targets natural gas in proximity to established infrastructure and aligns with short- to medium-term energy supply considerations rather than indicating a broad resurgence in exploration investment. Within this regional context, the proposed Asopus-1 well represents a single, gas-focused offshore exploration activity in Greek waters, consistent with the selective and project-specific nature of contemporary European exploration, and subject to project-specific environmental assessment and permitting under Greek and EU law.

### 4.3 Project historical development

Energean became the operator of Block 2 in early 2021 and initiated a comprehensive technical review of the lease area, accompanied by preliminary environmental screening activities. The technical review utilised available legacy subsurface data, regional geological information, and interpretations developed under previous operatorship. In parallel, the review concluded that existing seismic coverage and subsurface data were insufficient to reliably assess the Block's prospectivity or to advance potential exploration targets with an adequate level of confidence.

During this review, Energean identified that the geological model previously applied to the area—particularly regarding the Jurassic reservoir development and structural configuration—was associated with a high degree of uncertainty and did not fully align with the established geological framework of western Greece. To address these uncertainties and reduce exploration risk, Energean determined that acquisition of new, high-resolution three-dimensional (3D) seismic data across the license area represented the most effective means of improving subsurface understanding.

Energean subsequently conducted a 3D seismic acquisition programme covering the full extent of Block 2, implemented in accordance with environmental protection measures defined in the license conditions and agreed with the Competent Authority. In parallel, regional data integration incorporated available well data, outcrop studies, and published academic research from western Greece and the central and southern Mediterranean region. This work was undertaken to develop a revised geological model that more accurately reflects regional stratigraphy, structural style, and petroleum system elements in both onshore and offshore settings.

Interpretation of the newly acquired 3D seismic dataset confirmed the presence of a well-defined four-way structural closure at Jurassic level, subsequently named the Asopus prospect. The updated geological and structural model is internally consistent and shows good correlation with surface geological observations, regional well data, and seismic sequence stratigraphy calibrated to outcrop information. The improved data quality and integrated interpretation significantly increased confidence in the subsurface model relative to earlier datasets and interpretations.

Following completion of detailed technical evaluations, including geological interpretation, outcrop and analogue studies, seismic analysis, and petroleum system assessment, Energean and its co-venturers concluded that the Asopus prospect represents the most mature and technically robust candidate for exploratory drilling during the current exploration phase. In addition to the primary Jurassic objective, the updated interpretation identified a secondary, shallower target at Top Cretaceous level, which may also be tested within the same exploration well.

The environmental suitability of the proposed drilling location was evaluated through environmental baseline studies (EBS) and shallow hazard analyses, which did not identify environmental constraints that would preclude drilling, subject to implementation of the mitigation measures described in this ESIA.

On this basis, Energean advanced planning for a single vertical offshore exploration well, Asopus-1, designed to evaluate both the primary Jurassic and secondary Cretaceous targets. The proposed well represents the next step in the phased exploration strategy for Block 2. Results from drilling will be used to refine the geological model and inform any future appraisal or exploration decisions, which would be subject to separate technical evaluations, environmental assessments, and regulatory approvals. This ESIA addresses the environmental assessment of the Asopus-1 drilling operation only; any subsequent appraisal or development activities would be subject to separate environmental assessment and permitting in accordance with Greek and EU law.

#### 4.4 Economic valuation of GHG emissions

Greenhouse gas emissions for the 67-day campaign are estimated in detail in Section 6.11 of this ESIA (Carbon Footprint). This approximate quantity is 15.6 kt CO<sub>2</sub>e. This represents approximately 0.02% of Greece's 2022 annual GHG emissions<sup>13</sup> and is therefore assessed in this ESIA as not significant in the context of Greece's reported annual greenhouse gas emissions, based on the applied significance criteria. At the regional scale, the temporary emissions from the 67-day campaign represent a very small contribution relative to baseline emissions from shipping and offshore activity in the Ionian Sea.

Overall, the campaign's temporary duration, offshore location, and absence of planned venting or flaring mean that atmospheric emissions are short-term and operational in nature. Management measures will focus on fuel consumption, engine efficiency, logistics optimisation, compliance with MARPOL Annex VI fuel sulphur requirements, and the identification and reporting of any methane releases that may arise from in-scope exploration activities.

An indicative economic valuation of greenhouse gas (GHG) emissions has been undertaken to provide context for the potential climate-related costs associated with the drilling Project's activities. A representative carbon price has been applied using European Union Allowance (EUA) futures pricing, specifically the Intercontinental Exchange (ICE) EUA contract for March 2027, at €77.4 per tonne CO<sub>2</sub>e. EUA futures pricing is used here as an illustrative proxy for traded carbon, not as a substitute for jurisdiction-specific appraisal carbon values.

This carbon price is used as a proxy for the notional market-based value of carbon emissions, reflecting prevailing market-based valuation under the EU Emissions Trading System (EU ETS). It is for illustrative purposes only and does not represent a confirmed regulatory cost applicable to the Project.

Applying this unit value to the Project's estimated emissions results in an indicative carbon cost of approximately €1.21 million for the 67-day drilling campaign.

<sup>13</sup> According to the National Energy and Climate Plan, August 2024, GHG emissions in Greece in 2022 were 76.9 Mt (taking into account also carbon emissions and removals in the land use, land use change and forestry (LULUCF) sector).

This economic valuation is methodologically conservative, only in the sense that it applies a full traded carbon value to all conservatively estimated campaign GHG emissions, irrespective of their actual inclusion within carbon pricing mechanisms. In practice, the extent to which emissions from offshore drilling units, marine support vessels and aviation activities fall within the scope of EU ETS or other carbon pricing mechanisms depends on factors such as vessel classification, operational profile, and regulatory applicability under EU and Greek law at the time of operation.

The resulting monetised value is therefore intended as a contextual indicator of the potential climate-related cost of emissions, rather than a direct estimate of financial liability.

In this context, the estimated carbon value is modest relative to the overall scale of offshore exploration expenditure. This is consistent with current practice in EU EIA/ESIA procedures, where monetisation of GHG emissions is used as supporting contextual information and does not by itself determine significance.

## 4.5 Financial elements

The indicative total cost of the Asopus-1 exploration well is approximately USD 80 million (nominal), based on the phase-by-phase allocations presented in Table 4-1. The estimate is intended solely to indicate the potential financial scale of the proposed exploration activity for ESIA purposes and should not be interpreted as a final Authorisation for Expenditure or investment decision.

**Table 4-1: Indicative Exploration Drilling Cost Breakdown**

| COST CATEGORY         | PLANNING        | MOBILISATION   | EXPLORATION DRILLING OPERATIONS | P&A OPERATIONS | DEMobilISATION |
|-----------------------|-----------------|----------------|---------------------------------|----------------|----------------|
| Engineering & Studies | \$12.6mm        | \$0.1mm        | \$2.4mm                         | \$0.3mm        | \$1.3mm        |
| Materials             | \$0.5mm         | \$0.3mm        | \$4.0mm                         | \$0.3mm        | \$0.0mm        |
| Rig                   | -               | \$1.0mm        | \$24.0mm                        | \$2.7mm        | \$1.3mm        |
| Logistics Services    | \$2.8mm         | \$0.8mm        | \$9.4mm                         | \$1.1mm        | \$2.1mm        |
| Other Services        | \$1.2mm         | \$1.8mm        | \$7.7mm                         | \$0.5mm        | \$1.8mm        |
| <b>Total</b>          | <b>\$17.1mm</b> | <b>\$3.9mm</b> | <b>\$47.5mm</b>                 | <b>\$4.8mm</b> | <b>\$6.5mm</b> |

The estimate assumes a total offshore campaign duration of approximately 67 days, including mobilisation, drilling and evaluation of the exploration well, plug and abandonment activities as applicable, demobilisation of the drilling unit, and associated support spread, and the operation and closure of a temporary onshore logistics base.

For the purposes of this assessment, the estimate is based on a conservative upper-bound scenario, under which hydrocarbons of potential commercial interest are encountered. This scenario represents the maximum credible cost outcome for the exploration campaign and is used solely as a planning assumption for the ESIA context; it does not imply that a commercial discovery is expected or forecast.

The estimate is further based on the following key assumptions:

- all required permits, consents and regulatory approvals are obtained in time to support a planned spud date in February 2027;

- the Stena DrillMAX drilling unit is available and drills the well as currently planned;
- no significant non-productive time arises from major contractor or downhole downtime; and
- weather and metocean conditions remain within the normal operating range for the planned campaign and do not result in significant delays;
- the logistics and support strategy are implemented as currently planned, including the use of an established onshore supply base at the Port of Igoumenitsa and helicopter support operations based in Corfu (CFU), subject to final permitting and operational arrangements.

Actual project costs may vary from those presented depending on final well design, operational performance, rig, and marine spread market conditions, weather-related downtime and the final well outcome. If no hydrocarbons of commercial interest are encountered and the well is permanently abandoned immediately following drilling, the total cost would be lower than the conservative upper-bound estimate presented here.

## 4.6 Relation with other projects/activities

### 4.6.1 Operational, planned, and proposed projects within the Adriatic–Ionian corridor

The Asopus-1 exploration drilling programme is located within the wider Adriatic–Ionian marine energy and infrastructure corridor, where several existing, planned, and proposed projects contribute to an increasingly multi-use offshore environment. Potential spatial or functional interfaces with the Asopus-1 activities are briefly examined.

The Trans Adriatic Pipeline (TAP) natural gas transmission system is an operational component of the Southern Gas Corridor, transporting gas from the Caspian region to Europe via Greece, Albania, and Italy. The offshore component consists of a subsea crossing of the Adriatic Sea connecting Greece with Italy. TAP is a permanently installed, in-service energy transport asset with established safety zones and exclusion areas along its route (<https://www.tap-ag.com/infrastructure-operation/tap-route-and-infrastructure>).

No physical overlap exists between TAP infrastructure and the Asopus-1 Block 2 drilling location; however, both projects form part of the broader regional offshore energy system, and interaction is limited to general marine spatial use considerations (e.g. navigation routing and maritime planning interfaces).

The TERNA S.p.A. / IPTO promoted GR.ITA 2 project is a planned high-voltage direct current (HVDC) electricity interconnection between Greece and Italy. The project comprises a subsea cable system of approximately 240 km within a total route length of around 300 km, designed to enhance cross-border electricity exchange capacity and support EU decarbonisation objectives. The project is currently in the planning and development phase, with routing corridors and permitting processes subject to ongoing definition (<https://www.terna.it/en/projects/public-engagement/italy-greece-grita-2>).

While the cable alignment is not fixed at the level of operational detail required for direct assessment overlap, it represents a foreseeable marine infrastructure corridor within the wider Ionian Sea region. Any interaction with Asopus-1 is therefore limited to potential temporal coexistence of offshore works and general marine spatial coordination, rather than direct physical interference.

The IGI Poseidon S.A. EastMed–Poseidon concept comprises a proposed offshore and onshore gas transmission network intended to transport natural gas from Eastern Mediterranean resources to European markets via Greece and Italy. The system includes the EastMed offshore pipeline concept and the Poseidon interconnection segment between Greece and Italy (<https://igi-poseidon.com/eastmed-poseidon/>).

EastMed–Poseidon projects remain at a conceptual or strategic planning stage, with technical configuration, routing, and investment decisions not finalised. As such, there is no committed spatial interface with Asopus-1; any potential interaction is limited to high-level marine spatial planning considerations in the event of future project advancement.

#### 4.6.2 Sectoral upstream activities – Ionian offshore exploration

Published data from the Hellenic Hydrocarbons and Energy Resources Management Company (HEREMA / ΕΔΕΥΕΠ) confirm that offshore hydrocarbon exploration in Greece is currently concentrated in a limited number of active concessions, with a clear geographic clustering in the Ionian Sea and offshore Crete. These include Block 2, Block 10, the Ionian Block, Block A2, and the South Peloponnese concession, alongside four offshore blocks south and southwest of Crete, all of which are in exploration or early appraisal phases.

In the Ionian Sea, Block 2 and Block 10 represent the most advanced exploration areas, with ongoing seismic interpretation and preparation for potential exploration drilling activities, particularly in deeper offshore settings west of Corfu and along the Greek–Italian maritime boundary. These concessions involve international operators and joint ventures and include phased work programmes comprising 2D/3D seismic acquisition, geological modelling, and environmental baseline studies.

Collectively, these offshore concessions define the current sectoral upstream footprint in western Greek waters, and form the principal reference projects for cumulative assessment in relation to the Asopus-1 exploration well. Potential overlapping activities include:

- Marine geophysical surveys (2D/3D seismic acquisition and interpretation),
- Exploration drilling operations (where authorised under later phases),
- Offshore supply vessel movements and marine logistics support,
- Helicopter operations associated with crew changes and emergency response,
- Temporary installation of safety and exclusion zones during drilling campaigns.

The spatial interaction between concessions is generally limited by licensing boundaries and operational scheduling; however, temporal overlap of exploration campaigns across adjacent blocks may occur during peak operational periods. In particular, Block 2 (northwestern Ionian) and Block 10 (central Ionian) represent the most relevant potential cumulative activity sources due to their geographic proximity and similar development timelines.

The Asopus-1 well is therefore assessed within a broader regional upstream context characterised by low-density, phased and campaign-based exploration activity, rather than continuous industrial-scale offshore production. This reflects the early-stage nature of hydrocarbon exploration in Greek offshore basins and the absence of established offshore production infrastructure in the Ionian Sea.

Across all identified projects, no direct physical interaction or dependency is expected with the Asopus-1 drilling programme, based on current project definitions and available routing information. Interaction is limited to shared use of the wider marine environment, including established shipping routes, aviation corridors, and offshore operational space within the Ionian Sea. The Asopus-1 activity is a short-term, campaign-based operation within Block 2 and does not require or rely upon existing or planned infrastructure corridors.

## 5 Project compatibility with the existing regulatory provisions

### 5.1 Environmental permitting framework

#### 5.1.1 Concession (lease agreement)

“Block 2” was initially awarded to a joint venture comprising Total, Edison, and Hellenic Petroleum. The relevant Lease Agreement was executed with the Hellenic Republic on 31 October 2017 and subsequently ratified by Law 4525/2018 (GG A' 47 / 15.03.2018) *Ratification of the Lease Agreement between the Hellenic Republic and the companies “Total E&P Greece B.V.”, “Edison International S.p.A.” and “Hellenic Petroleum SA” for the granting of the authorization for the exploration and exploitation of hydrocarbons in the maritime Area 2, Ionian Sea, granting exclusive rights for the exploration and production of hydrocarbons within the concession area.*

Subsequent amendments to the joint venture composition, documentation of which is presented in Table 5-1 below, resulted in a revised partnership structure. Specifically, following the consent of the Minister of Environment and Energy granted under Ministerial Decision ΥΠΕΝ/ΔΥΔΡ/27224/552/10.03.2026, Energean holds 30% of the relevant rights, while the companies “ExxonMobil Exploration and Production Greece (Crete) B.V.” (“ExxonMobil”) and “Helleniq Upstream West Corfu Single-Member SA” (“Helleniq”) hold 60% and 10% of the relevant rights respectively (collectively, Energean, ExxonMobil, and Helleniq are referred to as the “Co-lessees”).

Table 5-1: Joint venture composition development

| LAW/DECISION AND RELEVANT REGULATORY DOCUMENTS | SUBJECT                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>MD ΥΠΕΝ/ΔΥΔΡ/93837/2284/30.9.2020</b>       | Consent for:<br>(a) the transfer of the participating interest of the company “Edison International S.p.A.” in the Lease Agreement to its affiliated company “Edison International E & P S.p.A.”, and<br>(b) the transfer of the participating interest of “Edison Exploration & Production S.p.A.”, an affiliated company of “Edison International E & P S.p.A.”, as well as the change of control of the latter company within the above Lease Agreement, subject to the completion of condition (a). |
| <b>MD ΥΠΕΝ/ΔΥΔΡ/114254/2781/30.11.2020</b>     | Consent for the transfer of a 50% participating interest, together with the corresponding rights and obligations under the Lease Agreement, from “Total E & P Greece B.V.” to “Energean Hellas Ltd”.                                                                                                                                                                                                                                                                                                    |

| LAW/DECISION AND RELEVANT REGULATORY DOCUMENTS                                                                         | SUBJECT                                                                                                                                                                                                                                                                                                |
|------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Decision of the Hellenic Hydrocarbon Resources Management Company (HHRM), reference number ΕΔΕΥ 8522/01.12.2020</b> | Consent for the change of Operator under the Lease Agreement, from the company “Total E & P Greece B.V.” to the company “Energean Hellas Ltd.”                                                                                                                                                         |
| <b>ΜΔ ΥΠΕΝ/ΔΥΔΡ/119755/3274/14.12.2021</b>                                                                             | Approval for the transfer of a 25% participating interest, together with the corresponding rights and obligations under the Lease Agreement, from “Energean International E & P S.p.A.” to “Energean Hellas Ltd”, as a transfer to an affiliated company pursuant to Article 20.1(c) of Law 4525/2018. |

In November 2025, ExxonMobil announced, during the Partnership for Transatlantic Energy Cooperation held in Athens, the execution of a farm-in agreement with the Energean – HELLENiQ ENERGY joint venture. ExxonMobil formally assumed the role of co-lessee on 10 March 2026, following the issuance of the Ministerial Decision approving the transfer of participating interests.

Upon completion of the minimum obligations under the initial exploration phase and following a positive technical evaluation of the area, the Co-lessees submitted, on 13 March 2026, formal notification of their intention to proceed to the second exploration phase, one day prior to the expiry of the first phase.

The second exploration phase entails, inter alia, the drilling of one exploration well, in accordance with the approved Minimum Work Programme as reflected in Table 5-2

Law 4525/2018 ratifies the Lease Agreement for offshore Block 2 in the Ionian Sea between the Hellenic Republic and a consortium originally composed of Total, Edison, and Hellenic Petroleum, granting it full force of law in Greece. The agreement provides exclusive rights for the exploration and potential production of hydrocarbons within the defined offshore block and establishes a phased exploration framework governed by a binding Minimum Work Programme. It sets out the applicable fiscal regime, including royalties, taxation, and potential state revenue mechanisms in the event of commercial discovery, while also embedding strict environmental obligations consistent with EU and national legislation, including requirements for environmental impact assessment and decommissioning.

More specifically, Law 4525/2018 is the Greek legislative act that ratifies and gives full legal force to the offshore hydrocarbons Lease Agreement for “Block 2” in the Ionian Sea, effectively transforming a negotiated concession contract between the Greek State and the consortium of companies into binding national law. Through this ratification, Parliament approves the transfer of exclusive rights for the phased exploration and potential exploitation of hydrocarbons within the Block 2 offshore area, while maintaining the fundamental principle that all subsurface resources remain State property. The law establishes a structured, phase-based exploration system requiring geological studies, seismic surveys, and potential exploration drilling, with strict deadlines and performance obligations, and provides that any transition to production is conditional upon commercial discovery and State approval of development plans. Importantly, it also embeds a stringent control mechanism whereby any transfer of participating interests, change of operatorship, or alteration of the consortium structure requires prior State consent, ensuring continuous regulatory oversight. In addition, it integrates the concession into the broader EU-aligned environmental and energy regulatory framework, including compliance with environmental impact assessment requirements, while placing implementation and supervision under the competent national hydrocarbons’ authority.

Table 5-2 below, presents the Lessee's work commitments during the exploration phase as described within the agreement.

**Table 5-2: Lessee's exploration work commitments as per the Lease Agreement ratified by Law 4525/2018 (Minimum Work Programme).**

| MINIMUM WORKS                 | PHASE 1<br>YEAR 1 TO YEAR 3                                         | PHASE 2<br>YEAR 4 TO YEAR 5                                              | PHASE 3<br>YEAR 6 TO YEAR 8                                |
|-------------------------------|---------------------------------------------------------------------|--------------------------------------------------------------------------|------------------------------------------------------------|
| <b>Firm activities</b>        |                                                                     |                                                                          |                                                            |

| Re-evaluation of seismic data | Magnetic & gravity survey (if possible, during seismic acquisition) | -                                                                        | -                                                          |
| Drilling                      | -                                                                   | One well                                                                 | One well                                                   |
| G&G                           | Geological studies, basin analysis                                  | Petrophysical and Geochemical analysis etc                               | Re-evaluation of G&G data                                  |
| HSE                           | Baseline report I, Environmental Action Plan (EAP), etc             | Baseline report II, Environmental Impact Assessment (EIA)                | Baseline report III, Environmental Impact Assessment (EIA) |
| <b>Contingent work</b>        |                                                                     |                                                                          |                                                            |
| Seismic acquisition           | -                                                                   | Acquisition of 3D seismic data (extent depending on 2D and well results) | -                                                          |

**Note:** The proposed Asopus-1 exploration well constitutes the Phase 2 drilling commitment under the Minimum Work Programme of the Lease Agreement, ratified by Law 4525/2018.

The law further defines governance and oversight provisions, requiring state approval for any transfer of participating interests and ensuring regulatory supervision throughout the lifecycle of the project. Dispute resolution and termination provisions are included under Greek law and international arbitration principles. Overall, the ratification law establishes the complete legal, fiscal, and environmental framework governing offshore exploration in Block 2 and enables long-term upstream energy activity under state-controlled regulatory oversight.

Article 12 of Law 4525/2018 states the reference terms and conditions concerning the environmental protection measures to be followed during the execution of the exploration program:

*12.1 All terms in this Article 12 will be considered according to the legislation in force, unless otherwise provided herein.*

*12.2 The Lessee shall:*

- a) conduct all Petroleum Operations in a manner which will ensure the protection of environment in accordance with Good Oilfield Practices;
- b) carry out all Petroleum Operations in full compliance with:
  - i. Environmental Laws;
  - ii. the Law on Offshore Safety;
  - iii. the approved Strategic Environmental Assessment (SEA);

- iv. the Terms of Environment (ToE) resulting from the relevant Environmental Impact Assessment (EIA) procedure; and
- v. any additional Environmental Action Plan (EAP), pursuant to this Article and Good Oilfield Practices, while ensuring that such operations are properly monitored;
- c) employ modern and appropriate techniques in accordance with Good Oilfield Practices, for preventing any environmental damage that might be caused by the Petroleum Operations, and for minimizing the environmental impacts of the Petroleum Operations and works within the Contract Area and in adjoining or neighbouring or more distant areas;
- d) properly and timely implement any Laws in force regarding the safety of Hydrocarbons exploration and production activities during the period of Petroleum Operations;
- e) procure that the documentation on environmental compliance in conducting Petroleum Operations, such as SEA, ToE or EAPs and associated documents are made available to its employees and to its contractors and their subcontractors to develop adequate and proper awareness of the measures and methods of environmental protection to be used in conducting Petroleum Operations; and
- f) ensure that any agreement between the Lessee and its contractors and their sub-contractors relating to the Petroleum Operations shall include the terms as set out in this Article 12 and any established measures and methods for the implementation of the Lessee's obligations in relation to the environment under this Agreement.

*12.3 The Lessee undertakes for the purposes of this Agreement to take all necessary and adequate steps:*

- to fully and timely fulfil all requirements of applicable Environmental Laws; and
- to prevent environmental damage to the Contract Area and neighbouring or more distant areas being caused by Petroleum Operations.

*12.4 If the Lessor has on reasonable grounds reason to believe that any works or installations erected by the Lessee or any operations carried out by the Lessee are endangering or may endanger persons or any property of any other person or are causing pollution or are harming wildlife or the environment to a degree which the Lessor deems unacceptable, the Lessee may take remedial measures within such period as may be determined by the Lessor and may repair any damage to the environment, the costs of such remedial action to be borne by the Lessee. If the Lessor deems it necessary, it may require the Lessee to discontinue Petroleum Operations in whole or in part until the Lessee has taken such remedial measures or has repaired any damage.*

*12.5 The measures and methods to be applied by the Lessee for purposes of complying with the terms of this Article 12 shall be determined in timely consultation and agreed with the Lessor prior to the commencement of the relevant Petroleum Operations, and whenever there is a significant change in the scope or method of carrying out Petroleum Operations, and the Lessee shall take into account Good Oilfield Practices as well as the relevant requirements of the ToE.*

*12.6 Pursuant to the above 12.2(a) provision, the Lessee shall prepare and submit to the competent governmental authority, an Environmental Impact Study (EIS) for the relevant Petroleum Operations in respect of which an EIA procedure is required. The EIS shall, as a minimum:*

- a) fully comply with the requirements of the EIA legislation in force;
- b) meet the requirements and guidelines set out by SEA; and

- c) be prepared by a third party with adequate expertise in the field of environmental studies, which will be appointed by the Lessee to work on its behalf

12.7 Each project, work, activity or any other part of the Petroleum Operations that is subject to an EIA, shall commence only after the ToE has been approved.

12.8 Any modification, expansion, improvement or modernization of a project, work, activity or any other part of the Petroleum Operations with approved ToE, requires compliance with the relevant provisions of EIA legislation. The same applies for the renewal (time extension) of the ToE decision.

12.9 In case of activities for which an EIA is not mandatory but nevertheless it is reasonably expected that some minor environmental impacts may occur, as in particular for the case of seismic surveys, the Lessee shall prepare an EAP, to determine, assess and mitigate these impacts, focusing on prevention and minimization thereof in accordance with Good Oilfield Practices.

12.10 The EAP shall be submitted to the Lessor for review and must be complied with by the Lessee.

12.11 The Lessee shall include in each Annual Work Programme and Budget to be submitted to the Lessor, an environmental report on the work to be undertaken as provided in that document, as well as on the work undertaken in accordance with the preceding Annual Work Programme and Budget.

12.12 Before carrying out any drilling activities, the Lessee shall fully meet the requirements of the applicable legislation for safety, contingency (i.e. oil spill, fire, accident, emissions etc.) and major hazard management plans.

12.13 In the event of any emergency or accident arising from Petroleum Operations affecting the environment, the Lessee shall immediately notify the Lessor, giving details of the incident and immediately implement the relevant contingency plan. In dealing with any emergency or accident affecting the environment, the Lessee shall at all times take such action as is prudent and necessary in accordance with the Environmental Laws and Good Oilfield Practices in the circumstances.

12.14 The Lessee shall not be liable for any environmental condition or damage existing in the Contract Area prior to the commencement of the Lessee's operation therein and nothing in this Agreement shall be construed to hold the Lessee liable in relation to any such pre-existing condition of damage. For this purpose, a baseline report shall be prepared by the Lessee, to detail the condition of the environmental parameters and resources at the time prior to operation commencement. The baseline report shall be submitted for review to the Lessor. If no objections will rise by the latter within twenty (20) Business Days, the report is deemed accepted.

## 5.1.2 Strategic Environmental Impact Assessment (SEA) for the offshore hydrocarbon exploration & exploitation areas in the Ionian Sea

Greece implements the Strategic Environmental Assessment (SEA) Directive 2001/42/EC primarily through JMD 107017/2006 "Approval of the Strategic Environmental Assessment (SEA) procedure for plans and programmes, in compliance with Directive 2001/42/EC", which establishes a mandatory framework for the environmental assessment of plans and programmes prior to their formal adoption. Under this system, any strategic instrument—such as sectoral policies, spatial planning frameworks, or energy and infrastructure programmes—must undergo an ex-ante evaluation of likely significant environmental effects, including the

analysis of reasonable alternatives and the “no action” scenario. The SEA process requires the preparation of an Environmental Report, followed by public consultation and, where applicable, transboundary consultation in line with international obligations, with environmental authorities required to ensure that mitigation measures are integrated, and that implementation is subsequently monitored. Importantly, the SEA establishes binding environmental constraints and conditions that must be carried forward into subsequent project-level Environmental Impact Assessments (EIA), effectively setting the parameters, assumptions, and mitigation requirements that any EIA must comply with and operationalize. In practice, this ensures that environmental considerations are embedded at the strategic planning stage while also cascading into the design and approval of individual projects assessed under Directive 2011/92/EU, such as offshore exploration or development activities.

According to the Strategic Environmental Assessment (SEA) that was conducted in order to cover the wider area of the Ionian Sea (HCMR, 2016) and its respective approval (DIPA, ref. no. 30373/3.7.2017), the overall environmental framework to govern the E&P workstreams for the O&G offshore blocks (1 to 11).

Moreover, chapter B of the approved Strategic Environmental Assessment study states the terms, constraints and guidelines for environmental protection and management as follows:

*9. Prior to the commencement of exploratory drilling, and sufficiently in advance for the findings to be taken into account in the relevant Environmental Impact Assessment (EIA), detailed geohazard studies shall be prepared for the area of influence of each drilling operation. These studies shall analyze, at a minimum:*

- 9.1. The stability of slopes and the likelihood of landslides.*
- 9.2. The presence of gas pockets or gas-filled craters that could release gas.*
- 9.3. The presence of mud volcanoes and the level of risk they pose.*
- 9.4. The presence of unstable gas hydrates and the extent of their occurrence.*
- 9.5. The presence of active seismogenic faults in the area.*

*10. In order to prevent, to the maximum extent practicable, accidents that could have an impact on the environment, all drilling activities and their associated operations, whether conducted for exploratory or production purposes, shall be designed from the outset to ensure full compliance with Law 4409/2016 (Government Gazette A' 136), which establishes the framework for safety in offshore oil and gas exploration and exploitation operations by transposing Directive 2013/30/EU and amending Presidential Decree 148/2009. The findings of the above-mentioned geohazard studies shall be taken into account in the Major Hazard Reports required under the provisions of the above law.*

*11. In addition to the risks associated with the nature of drilling operations, and with a view to preventing accidents with potential environmental impacts, the Major Hazard Report required under Law 4409/2016 shall ensure that the safety assessment for each drilling operation takes into account the high seismic activity that characterizes the area, as well as the specific characteristics of the marine environment and its dynamics. With regard to these two aspects, safety factors shall be maximized by applying approaches, methods, and technical solutions that have been successfully implemented in comparable cases, addressing at least the following issues:*

11.1. Adoption of design assumptions that provide an adequate safety margin beyond the maximum anticipated duration of the entire project lifecycle, including construction, operation, decommissioning, and site restoration.

11.2. Selection of methods and materials that are suitable for use under conditions of high seismic activity.

11.3. Protection of equipment against the maximum expected wave conditions and the most severe foreseeable storm and rough sea events.

11.4. Preparation and immediate availability of detailed computational spill-dispersion models for use in the event of an oil spill, in order to enable a prompt and effective response.

12. Within the framework established by the above safety requirements, the selection of the drilling location, particularly where alternative locations are available, shall also take into account environmental considerations based on the following parameters and criteria:

12.1. Avoidance of locations that fall within, or are in the immediate vicinity of, the Register of Protected Areas established under the applicable River Basin Management Plans (RBMPs) for the areas covered by the program.

12.2. Consideration of the relationship between the proposed drilling location and previous drilling operations, with the objective of avoiding cumulative or systematic impacts on marine ecosystems.

12.3. Assessment of the environmental sensitivity of the immediate vicinity of the proposed drilling location, taking into account the ecological significance of the directly affected water column and benthic biological community, as well as the proximity of the location to protected areas. A specific assessment shall be carried out for seabed ecosystems (whether based on photosynthesis or chemosynthesis), including the potential presence of corals or other significant or sensitive ecological features.

12.4. Identification of significant elements of cultural heritage or technological infrastructure, such as archaeological remains, shipwrecks, submarine cables, and similar features, taking into account the thematic maps referred to in Condition 7.1\* and following a detailed visual inspection of the seabed, with the objective of avoiding adverse impacts on these features.

12.5. Consideration of human marine activities, such as aquaculture, fisheries, navigation, and tourism, with the objective of minimizing impacts on those activities.

13. During the design of the drilling operation, and in addition to compliance with the safety requirements of Law 4409/2016, detailed provision shall also be made to ensure compliance with the following environmental protection requirements:

13.1. The design shall incorporate appropriate technical solutions and management measures to ensure, in the following order of priority:

- resistance to any pressures or other forces that may be exerted during drilling, to prevent, to the maximum extent practicable, any accident with potential environmental consequences;

- inspections of sufficient scope and frequency to verify the proper operation of all safety systems, particularly critical systems such as the blowout preventer (BOP), the choke manifold, and other essential well-control equipment;
- provision of appropriate systems and emergency response plans for incidents such as the release of hydrogen sulfide (H<sub>2</sub>S) and other emergency situations;
- facilities and procedures for the collection of drilling wastes to enable their pre-treatment (e.g. separation processes) and their appropriate management and disposal, according to their nature and the degree of contamination by toxic, hazardous, or environmentally harmful substances;
- limitation, wherever technically feasible, of the dimensions of the initial riserless drilling phase to the minimum necessary.

*13.2. The drilling mud (drilling fluid) used throughout all phases of drilling shall, as a matter of priority, be water-based and shall not contain substances listed in Annexes I and II of the Protocol of the Barcelona Convention for the Protection of the Mediterranean Sea against Pollution Resulting from Exploration and Exploitation of the Continental Shelf and the Seabed and its Subsoil, which identify substances that are either prohibited or require special treatment prior to disposal. Oil-based drilling mud may be used only where its complete recovery is ensured and any possibility of pollution is prevented.*

*13.3. Preparedness for responding to pollution incidents shall be comprehensive and maintained at all times, at a minimum through:*

- preparation and approval of the appropriate contingency plans required under the applicable legislation;
- maintaining on site, and in a state of immediate operational readiness, all equipment required under the above-mentioned plans;
- scheduling emergency response exercises at a frequency and with an organization sufficient to ensure the effective response of personnel to pollution incidents.

*13.4. Well testing involving flaring shall employ high-efficiency flare burners equipped with systems designed to minimize atmospheric pollutant emissions.*

*13.5. The disposal of drill cuttings (the material removed from the seabed by the drill) shall comply with the applicable legislation governing waste management and the protection of the Mediterranean Sea. As a priority, the cuttings shall be transported and managed at appropriately licensed waste management facilities. Where it is demonstrated that the cuttings consist exclusively of inert materials, are free from contaminants, and that transport to such facilities is objectively impracticable, their disposal at a suitable offshore location of low environmental sensitivity may be considered. The identification and environmental authorization of such a disposal site shall form part of the approval of the environmental terms for the overall drilling project.*

*14. During the execution of each exploratory drilling operation, the provisions, design choices, and outcomes of the design stage shall be implemented in full and without deviation, through an*

implementation control system and appropriate record-keeping, so that the environmental protection measures incorporated at the design stage (including compliance with the environmental terms and conditions) are effectively put into practice. In addition:

14.1. No material or substance of any kind shall be discharged into the sea other than seabed drill cuttings, provided that such discharge is authorized under the Environmental Terms Approval Decision (AEPO). These materials shall be separated from the drilling fluids using the best available techniques and shall be disposed only at the location that has been designated and authorized for this purpose as described above. All other materials and substances shall be collected and transported for management and disposal in accordance with the applicable waste management legislation.

14.2. The execution and management of individual operations (such as cementing and other sealing operations, well testing involving flaring, maintenance activities, and similar works) shall be organized and carried out so as to minimize environmental impacts. The corresponding measures shall constitute a dedicated section of the Environmental Impact Assessment and of the associated approval of the environmental terms.

14.3. Impacts on navigation shall be minimized.

15. Abandonment of each drilling site shall be subject to the implementation of all necessary measures to ensure the complete prevention of potential environmental impacts. These measures shall reflect the highest available level of technological solutions and shall be addressed in a dedicated section of the Environmental Impact Assessment and the associated approval of the environmental terms.

*\*Condition 7.1 of the approval of the Strategic Environmental Assessment study for the exploration and exploitation of hydrocarbons in eleven marine areas in the Ionian Sea (Respective SEA Approval No 30373, 03.07.2017)*

Chapter C, of the same approved Strategic Environmental Assessment study states the monitoring system for the significant environmental impacts arising from the implementation of the program:

1. To monitor the significant environmental impacts, an integrated system shall be developed on the basis of the following principles:

1.1. Monitoring shall concern both the condition of the environment in the wider area affected by the works of hydrocarbons exploration and areas of direct impact.

1.2. For the purposes of monitoring, wider area shall mean at least the entire applicable active exploration and exploitation concession area. In this area, physical and chemical properties of key environmental sectors shall be recorded, such as mainly:

- marine waters, including their physical and chemical properties as well as the dynamics of currents,
- local meteorology, particularly to the extent it affects water dynamics,
- the surface layer of the seabed, particularly regarding its role in the health of marine ecosystems.

1.3. In the immediate area, monitoring should cover all the above and additionally include magnitude and indicators related to

- the implementation of environmental conditions to be approved for each individual project,
- compliance with safety procedures related to the prevention of accidents with environmental impact.

1.4. The spatial and temporal density of the recordings, and the means used to make them (e.g. permanent or mobile stations, suitable vessels etc.) must be selected according to the scale of the phenomena to be monitored, with appropriate variations between the immediate and wider area.

1.5. In the wider area, to understand and correlate the parameters, integrated computational simulations with analytical forecasting potential shall be developed, using existing initiatives such as the "Poseidon" system ([www.poseidon.hcmr.gr](http://www.poseidon.hcmr.gr)). Measurements and recordings in the wider area should be designed and conducted in a manner that allows the validation of computational results.

1.6. The collection and processing of data for the monitoring of environmental impacts should be conducted annually. During each year, data shall be collected on a more regular basis, to allow trending with a shorter temporal development.

1.7. Environmental indicators will be used as key monitoring parameters which should represent in a comprehensive way important aspects of the developments with regards to the quality of the environment.

1.8. Once the production prospects have been finalized, a seismicity activity monitoring system should be established, using appropriate technology and the existing seismographic network. This system should actively contribute to the safety of the production facilities, by monitoring the temporal evolution of the local micro-seismicity and macro-seismicity, as well as of other data related to the deformation of the ground. The technical details of the above system and the way in which it will comply with the above guidelines and safety requirements pursuant to L. 4409/2016 will be a distinct part of the relevant Environmental Impact Assessment (EIA)

2. Monitoring shall be carried out under the responsibility of the Environmental Unit provided for in paragraph B.II.1\*.

3. The monitoring system shall be designed by the Environmental Unit and communicated to the Planning Authority, which, at its discretion and/or following opinions provided by competent authorities or case-specific expert committees, may request amendments or improvements.

4. The final determination of the complete set of indicators to be monitored shall constitute part of the preparation of the monitoring program. Indicatively and not exhaustively, the following indicators may be recorded:

- 4.1. Marine water quality indicators, including physicochemical and biological characteristics.
- 4.2. Marine ecosystem integrity indicators, covering both photosynthetic and chemosynthetic biological communities.
- 4.3. Ecosystem service indicators reflecting the services provided by the marine environment to local communities, including fisheries and tourism, with the selection of parameters and

characteristics capable of representing the evolution of these services and any potential impacts arising from the program.

4.4. Indicators of the progress of program implementation, in terms of projects and activities completed, as well as those planned for the following year.

5. The results of monitoring environmental impacts shall be compiled into an annual report, which shall also include an assessment of those results and proposals for any corrective actions that may be required. This report shall be made publicly available by being posted on a website that the Environmental Unit shall be required to maintain. The same website shall provide interested members of the public with the opportunity to submit their comments on the content of the report.

\*B.II.1.: The comprehensive responsibility for preventing, minimizing, and addressing environmental impacts shall be assigned to a dedicated Environmental Unit. This Unit shall be established and operated under the sole responsibility of the entity to which the right to explore for and exploit hydrocarbons in each area has been granted, while it shall be supervised by the Planning Authority.

The table below outlines the main environmental constraints identified and the recommendations that need to be carried forward in the Project ESIA process to prove compliance with the wider environmental regulatory framework, as anticipated in the pertinent Strategic Environmental Assessment (SEA) of the Ionian Sea Concession blocks:

**Table 5-3: Compliance requirements to be demonstrated as satisfied within the Project EIA, based on SEIA**

| Environmental constraints                                                               | Compliance criteria                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Applicable in the exploratory drilling phase                           |
|-----------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------|
| Effects of Airgun Noise on Marine Mammals and Turtles                                   | During seismic surveys, licenses should be required to implement a protocol to reduce the risk of auditory trauma to marine mammals and sea turtles. As a minimum provision, the protocol should allow for: soft start, visual monitoring, acoustic monitoring, shutdown of the array.                                                                                                                                                                                                                                                                                                                                                           | Yes, conditional that usage of airguns is foreseen as part of the VSP. |
| Effects of Sea Floor Disturbances and Drilling Discharges on Benthic communities        | Prior to conducting activities that involve drilling, anchoring, placement of drilling rigs or production facilities on the sea floor, or installation of pipelines, licenses should be required to use high-resolution seismic survey (i.e., geohazards) data, 3D seismic survey data, and any other pertinent information available to identify hard bottom areas that could support important such communities. If any such areas are identified, licensees should be required to conduct mud and cuttings discharge modeling and/or to establish a separation distance that will protect these hard bottom areas and associated communities. | Yes                                                                    |
| Effects of Sea Floor Disturbances and Drilling Discharges on Chemosynthetic Communities |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Yes                                                                    |

| Environmental constraints                                                                          | Compliance criteria                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Applicable in the exploratory drilling phase                                                                                                                                                                                                       |
|----------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Effects of Sea Floor Disturbances on Shipwrecks and Submerged Archaeological Resources</b>      | Prior to conducting exploration or exploitation activities that involve anchoring, placement of drilling rigs or production facilities on the sea floor, or installation of pipelines, licensees should be required to conduct a remote sensing survey of the sea floor to evaluate the potential for shipwrecks and other submerged archaeological resources. Licensees should be required to submit an archaeological assessment report by a qualified marine archaeologist to include any identified archaeological resources and recommendations for avoidance or further investigation. Based on the report, the Ministry could require avoidance or other protective measures. | Yes                                                                                                                                                                                                                                                |
| <b>Effects of Seismic Survey Vessels and Towed Streamers on Fishing, aquacultures and shipping</b> | Implementation of voluntary measures as the soft start, in order to reduce impact on fish. Licensees should be required to consult with stakeholders prior to conducting streamer surveys to ensure that conflicts with fishing, aquaculture and shipping activities are minimized.                                                                                                                                                                                                                                                                                                                                                                                                  | Yes                                                                                                                                                                                                                                                |
| <b>Effects of Well Testing on Air and Water Quality</b>                                            | During well testing, licensees should be required to:<br>(1) use a high-efficiency burner to reduce the amount of hydrocarbon fallout and<br>(2) monitor the sea surface to ensure that no visible sheen is produced.<br>(3) comply with MARPOL requirements in relation to all kind of wastes, effluents, emissions                                                                                                                                                                                                                                                                                                                                                                 | Yes, conditional that there is well testing included in the planned drilling operations. For clarity, no well testing is planned for the exploration well Asopus-1                                                                                 |
| <b>Effects of Helicopter Traffic on Important Bird Areas</b>                                       | Licensees should be advised that helicopters engaged in support operations should avoid flying over SPAs and IBAs when traveling to or from the drilling rig. A map of SPAs and IBAs should be provided for this purpose.                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Yes                                                                                                                                                                                                                                                |
| <b>Effects of Structure Removals on Marine Mammals and Sea Turtles</b>                             | Licensees should be required to follow international best practice for safe structure removal during decommissioning. Prior to structure removals, a decommissioning plan should be prepared that includes monitoring for the presence of marine mammals and sea turtles to avoid effects of underwater detonations.                                                                                                                                                                                                                                                                                                                                                                 | Yes, as all temporary subsea equipment deployed during the drilling campaign will be retrieved using a remotely operated vehicle (ROV). A post-operation seabed survey will be conducted to confirm clearance of debris and recovery of equipment. |
| <b>Effects of Oil Spills and hydrogen sulphide on the Marine Environment</b>                       | Elaboration by the license holders of a plan to assess the hydrocarbon leak probability and possible resulting fire and how to fight against them, but also in accordance with the International Convention for the Prevention of Pollution from Ships, 1973 (MARPOL), ships as rigs are required to have in place a contingency plan for dealing with oil pollution (Shipboard Oil Pollution and Emergency Plan, SOPEP), submitted in delegating Ministry for evaluation and approval.<br><br>Conduct a spill trajectory model to identify likely spill trajectories, using seasonal meteorological and oceanographic data.                                                         | Yes                                                                                                                                                                                                                                                |

| Environmental constraints                           | Compliance criteria                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Applicable in the exploratory drilling phase |
|-----------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------|
| <b>Transboundary Environmental Impact</b>           | <p>During the process of hydrocarbon activities, the relevant provisions of the Barcelona Convention should be considered, which regulates in detail such matters, the EU Directives (e.g. Directive 2013/30) and the Law of the Sea and other legislative frameworks. In addition, a detailed analysis of the provisions of the Barcelona Convention offshore Protocol and its Annexes must be undertaken, to confirm that all the research and exploitation activities of hydrocarbons in the license area are in line with the requirements of this protocol.</p> <p>On ensuring cross-border availability and compatibility of intervention tools, it is noted that Greece is a member of the OPRC Convention (Oil Pollution Preparedness, Response and Cooperation, n. 2252/1994) which regulates in detail such issues, while poses the needed National Contingency Plan in order to address pollution from oil and other harmful substances (PD 11/2002).</p> | Yes                                          |
| <b>Discharge Control, Management and Monitoring</b> | <p>Discharge requirements should be established for drilling fluid and cuttings, produced water (if any), and other effluents from hydrocarbon activities in the license area. In developing the requirements, the Barcelona Convention offshore protocol. The OSPAR Convention offshore oil and gas industry strategy may be considered as sources of guidance, as well as MARPOL convention and the directive 2013/30/EC. In addition, it is recommended that detailed requirements of the Barcelona Convention offshore protocol and its annexes should be reviewed to ensure that all hydrocarbon activities in the license area are consistent with the requirements of the protocol.</p>                                                                                                                                                                                                                                                                       | Yes                                          |

### 5.1.3 Existing permitting status of Igoumenitsa Port and Corfu International Airport (CFU)

The Port of Igoumenitsa is currently covered by a valid Environmental Terms Approval Decision (AEPO), originally issued through Joint Ministerial Decision (JMD) No. 144974/08.06.2005 for the construction and operation of Phase B of the New Port and subsequently amended by JMD No. 139663/18.05.2009 to incorporate the Phase C expansion works under a single environmental approval. The AEPO was further amended in 2013 to permit the establishment and operation of a temporary construction site, including a concrete batching plant and associated ancillary facilities required for the execution of the Phase C works. These amendments did not alter the overall scope of the port development but introduced additional environmental conditions governing the temporary construction of facilities.

The environmental permit currently in force is Decision ΥΠΕΝ/ΔΙΠΑ/12891/794/17.03.2022, which extended the validity of the original AEPO until 25 September 2035 and updated its environmental conditions to reflect the current environmental regulatory framework established under Law 4014/2011 and subsequent legislation. The Decision also approved the replacement of the environmentally licensed concrete batching plant with a modern installation of equivalent function, concluding that the modification would not result in significant additional environmental impacts and therefore did not require the preparation

of a new Environmental Impact Assessment. In addition, the Decision revised and supplemented several environmental conditions relating to air quality, water and marine protection, waste management, environmental monitoring, noise, flood risk, and compliance with the River Basin and Flood Risk Management Plans applicable to the Epirus Water District.

Accordingly, the Port of Igoumenitsa currently operates under a valid and consolidated environmental permitting framework that incorporates the original environmental approval together with all subsequent amendments and extensions. The AEPO remains valid until 25 September 2035, subject to compliance with its environmental terms and conditions, after which the project owner is required to initiate the renewal procedure in accordance with Article 5 of Law 4014/2011, as amended.

The Port Development Plan (Master Plan) was updated in 2013 to reflect revised traffic forecasts and the long-term development needs of the Port of Igoumenitsa, adopting a planning horizon to 2038. The update sought to optimise the spatial organisation of the port through the allocation of operational areas, land uses and supporting infrastructure, ensuring the efficient use of the available port area and accommodating the completion of the Phase C expansion works.

The updated Master Plan was approved through Ministerial Decision No. 8216/126/2014, entitled "*Update of the Igoumenitsa Port Development Plan*". The Decision established the revised spatial planning framework, including land-use allocations, building conditions and development provisions for the port area, and constitutes the statutory planning framework governing the future development and operation of the Port of Igoumenitsa.

The 2014 approved Port Development Plan (Master Plan) defines the functional zoning of the Port of Igoumenitsa, including the Old Port Area, Ferry Terminal Area, Cruise Area, Central International Ferry Area, Unaccompanied Freight and Ro-Ro Area, and the Southern Supplementary International Ferry Area, together with the corresponding land-use allocations and building conditions.

Figure 5-1 presents the operational areas within the port's-controlled land zone. The Areas of Interest are located within Operational Areas 06 (Area 1) and ΠΑ (Area 2) of the Port of Igoumenitsa, as defined in the approved Port Development Plan (Master Plan) (Ministerial Decision 8216/126/2014). These areas form part of the designated operational port zone and are zoned and planned for port-related activities and associated supporting infrastructure.

Corfu International Airport ("Ioannis Kapodistrias" - CFU) currently operates under a valid Environmental Terms Approval Decision, originally issued by Ministerial Decision No. 11945/08.03.2017 for the operation of the existing airport and the implementation of modernization, improvement and maintenance works to its infrastructure. The environmental approval was subsequently amended in 2018 to update specific environmental conditions and, most recently, by Decision ΥΠΕΝ/ΔΙΠΑ/123235/8107/23.11.2022, which remains the applicable environmental permit governing the operation and development of the airport.

## 5.2 Legislative framework

### 5.2.1 Legislation related to hydrocarbon exploration and production

#### 5.2.1.1 National Law 2289/1995 for exploration, research and exploitation of hydrocarbons

Law 2289/1995 (GG A' 27 / 08.02.1995) "Exploration, research and exploitation of hydrocarbons and other provisions" established Greece's foundational hydrocarbons regime by confirming State ownership of all subsurface resources and introducing a licensing system for private exploration and production under strict state control. The law introduces a structured licensing system based on competitive tenders or negotiated awards, requiring companies to demonstrate technical and financial capability and to commit to binding work programmes divided into exploration phases with strict timelines. It regulates the full upstream lifecycle, from geological surveys and seismic exploration to exploratory drilling and, in the event of a commercial discovery, the granting of production rights subject to State approval of development plans and environmental permitting. It also defines the fiscal regime through royalties, taxation, and potential bonus payments, while embedding strong environmental obligations, including compliance with EU directives, mandatory environmental impact assessments, and decommissioning requirements. Importantly, the law grants the State extensive regulatory control, including oversight of operations, approval of transfers of participating interests, and the ability to enforce compliance or terminate rights where obligations are not met, thereby creating a contract-based but firmly state-controlled hydrocarbons regime.

The law is divided into the following sections and articles:

#### CHAPTER A

##### EXERCISE OF STATE RIGHTS

- **Article 1** – Definitions
- **Article 2** – State Rights over Hydrocarbons; Prospecting, Exploration and Exploitation of Hydrocarbons; Methods of Granting Rights; Exploration and Exploitation through Lease Agreements and Production Sharing Agreements.
- **Article 3** – State Participation in Hydrocarbon Exploration and Exploitation; Exploitation without Prior Exploration under a Lease Agreement or a Production Sharing Agreement.
- **Article 4** – Contractors

#### CHAPTER B

##### RIGHTS AND OBLIGATIONS OF THE CONTRACTOR

- **Article 5** – Rights and Obligations of the Contractor during the Exploration Phase and the Exploitation Phase – Unified Exploration and Exploitation of Adjacent Areas
- **Article 6** – Execution of Operations and Works – Rights over Immovable Property – Contractors and Subcontractors – Imports, Exports and Procurement – Foreign Personnel of the Contractor
- **Article 7** – State Right to Purchase Produced Products – Assignment of Rights by the Contractor – Control of the Contractor's Activities and Expenditures – Ownership of Hydrocarbons
- **Article 8** – Income Taxation

- **Article 9** – Assignment Rights under Lease and Production Sharing Agreements; Tax and Other Exemptions
- **Article 10** – Exploitation Stage Contract; Suspension and Extension of Time Limits; Contractor Default and Termination; Dispute Resolution

## CHAPTER C

### PROVISIONS CONCERNING D.E.P. – E.K.Y. GENERAL PROVISIONS

- Article 11
- **Article 12** – Compulsory Expropriation – Granting of Rights to Use Public Property, the Seashore and Marine Areas – Offshore Installations and Structures – Exploitation of Hydrocarbons on the Continental Shelf or within the Exclusive Economic Zone (EEZ) – Installations within Territorial Waters – Safety Measures – Environmental Protection – Criminal and Administrative Sanctions – Social Security – Representation of the State

## CHAPTER D

### REGULATION OF PETROLEUM PRODUCTS MATTERS AND OTHER PROVISIONS

- Article 13
- Article 14
- Article 15
- **Article 16** - Amendment of the Provisions of Law 336/1976
- Article 17
- Article 18
- Article 19
- Article 20
- **Article 21** – Entry into force

#### 5.2.1.2 National Law 4001/2011 on Electricity, Natural Gas and Hydrocarbons

Over time, the law was not replaced but progressively modernised with Law 4001/2011 “On the operation of electricity and natural gas energy markets, on the exploration, production and transportation networks of hydrocarbons, and other regulatory provisions” including provisions that develop and modernize Law 2289/1995 by integrating the hydrocarbons exploration and production regime into a broader and more comprehensive energy and regulatory framework fully aligned with European Union law. While Law 2289/1995 establishes the fundamental concession-based contractual model, the principle of State ownership of hydrocarbons, and the licensing system for exploration and production, Law 4001/2011 (GG A’ 179 / 22.08.2011) introduces institutional modernization of the energy market, strengthens the role of the Regulatory Authority for Energy (RAE) as an independent regulator, clearly separates regulatory from operational State functions, and integrates hydrocarbons into a unified energy system covering electricity, natural gas, and transmission networks.

At the same time, it enhances transparency and competition in licensing procedures, promotes EU principles of market access, and establishes a more structured and stringent regulatory oversight framework for energy

activities, without altering the core principle of Law 2289/1995 regarding State ownership of natural resources, but instead transforming the overall regime from a purely contractual concession model into a hybrid system in which the market operates under strong regulatory and institutional supervision.

In 2018, the system was significantly refined through reforms that reinforced concession-style agreements, formalised transfer controls, and enabled parliamentary ratification of offshore contracts such as Block 2 (Law 4525/2018); and in the post-2020 period, the framework has evolved into a contract-and-administration-driven system where legal continuity is maintained through the original 1995 law, while operational flexibility is managed via detailed lease agreements, directly enforceable through parliamentary ratification (GG). As a result, Greece's hydrocarbons regime today functions as a hybrid structure combining a stable 1995 legal foundation, EU-aligned regulatory oversight, and contract-specific governance for individual offshore blocks.

## 5.2.2 Broader framework of environmental permitting

### 5.2.2.1 Directive 2011/92/EU on the assessment of the effects of certain public and private projects on the environment (EIA)

Environmental Impact Assessment (EIA) was introduced for the first time in Europe in 1985 by the EIA Directive (85/337/EEC) and represents the first key instrument in European Union's environmental policy that puts into force the obligation to account the environmental parameter / impact of projects / activities at the stage of implementation of decisions. Some of notable features include:

- The range of projects and activities, ranging from industrial and other productive activities to infrastructure projects such as roads, dams, ports mainly in the form of public investment.
- The requirement to prior (ex-ante) impact assessment so that environmental issues can be fully incorporated in the design, implementation and operation.
- Opening the process to the public which asked to be informed and to participate in decision-making.
- And finally, the requirement for detailed and comprehensive information on the impact on the environment, i.e. environmental impact study.

The EIA procedure as specified in the relevant Directive is summarized in the following stages:

- The project developer may request the competent environmental authority to identify the issues that should be covered by the Environmental Impact Assessment and the relevant information that should be provided by the investor (scoping).
- The investor must provide the required information on the environmental impacts of the project (Environmental Impact Assessment - EIA, Annex IV) to the competent authority.
- The competent environmental services, the public (and the affected Member States) must be informed and give their opinion on the EIA.
- The competent environmental authority decides whether to approve the project or not, considering the results of the EIA consultation. The public is informed of the decision, which can also challenge before court.

The EIA Directive applies to a wide range of public and private projects, which are defined in Annexes I and II of the aforementioned Directive. Projects included in Annex I are considered to have significant effects on the environment and require an EIA procedure.

For projects listed in Annex II, the National Authorities should decide through a screening process whether an EIA procedure is required, considering criteria/thresholds or a case-by-case examination, as well as the criteria in Annex III. Twelve years later, and following a whole new service industry on the environmental impact assessment sector and drawing conclusions from the hitherto implemented, the EIA Directive was amended by 97/11/EC in order to:

- Be in line with the Espoo Convention on the assessment of transboundary impacts on the environment.
- Extend the EIA to more types of projects and activities.
- Improving and expanding the criteria against which a project is subject to fall within the obligations of an EIA.

EIA Directive has been further amended twice through Directive 2003/35/EC (harmonized public participation process with provisions of Aarhus Convention) and Directive 2009/31/EC (prescription for CO<sub>2</sub> transport and storage projects). This was eventually codified by Directive 2011/92/EU of 13<sup>th</sup> of December 2011.

The most recent update of the EIA Directive (2014/52/EU) entered into force on 15 May 2014 to simplify the rules for assessing the potential effects of projects on the environment. The member states (MS) need to have finalised the transposition into their legislative frameworks until 16 May 2017.

The update is in line with the drive for smarter regulation, so it reduces the administrative burden. It also improves the level of environmental protection, with a view to making business decisions on public and private investments more sound, more predictable and sustainable in the longer term. The latest approach pays greater attention to threats and challenges that have emerged since the original rules came into force some 25 years ago.

This means more attention to areas like resource efficiency, climate change and disaster prevention, which are now better reflected in the assessment process. The main amendments are as follows:

- Member States now have a mandate to simplify their different environmental assessment procedures.
- Timeframes are introduced for the different stages of environmental assessments: screening decisions should be taken within 90 days (although extensions are possible) and public consultations should last at least 30 days. Member States also need to ensure that final decisions are taken within a "reasonable period of time".
- The screening procedure, determining whether an EIA is required, is simplified. Decisions must be duly motivated in the light of the updated screening criteria.
- EIA reports are to be made more understandable for the public, especially as regards assessments of the current state of the environment and alternatives to the proposal in question.
- The quality and the content of the reports will be improved. Competent authorities will also need to prove their objectivity to avoid conflicts of interest.
- The grounds for development consent decisions must be clear and more transparent for the public. Member States may also set timeframes for the validity of any reasoned conclusions or opinions issued

as part of the EIA procedure.

If projects entail significant adverse effects on the environment, developers will be obliged to do the necessary to avoid, prevent or reduce such effects. These projects will need to be monitored using procedures determined by the Member States.

Existing monitoring arrangements may be used to avoid duplication of monitoring and unnecessary costs. According to Article 1 of the Directive, this shall apply to the assessment of the environmental effects of those public and private projects, which are likely to have significant effects on the environment.

Although specific procedures may vary significantly among different Member States, the principal phases of the EIA Process are common to the European Community. Figure below, presents a flow chart of the EIA process phases, distinguishing the compulsory phases (highlighted in yellow) from the optional EIA procedures (not highlighted).

Figure 5-3: Flow chart of EIA process as per EU Directive

The methodology used for preparing this ESIA Study has been developed in accordance with the requirements of Directive 2011/92/EU on the assessment of the environmental effects of certain public and private projects, as amended by Directive 2014/52/EU. It is in line with the relevant national laws implementing this Directive into Greek law, including Law 4014/2011, as amended by Law 4685/2020. Overall, the approach is consistent with the applicable EU legal framework governing the ESIA process.

### 5.2.2.2 Legislative Framework for Impact Assessment

The framework for impact assessment – permitting is governed by the following (including the ratification of the conventions, as applicable), as presented in the table below.

Table 5-6: Applicable legislative framework for the impact assessment – permitting of offshore installations

| LAW/DECISION AND RELEVANT EUROPEAN (EU)/INTERNATIONAL DOCUMENTS                                   | REFERENCE NUMBER       | SUBJECT                                                                                                                                                                                              |

| <b>ACCOBAMS</b>                                                                                                                                                                                             | -                                                                                            | Agreement on the Conservation of Cetaceans of the Black Sea, Mediterranean Sea and contiguous Atlantic area                                                                                                                                    |

| LAW/DECISION AND RELEVANT EUROPEAN (EU)/INTERNATIONAL DOCUMENTS | REFERENCE NUMBER    | SUBJECT                                                                                     |
|-----------------------------------------------------------------|---------------------|---------------------------------------------------------------------------------------------|
| <b>Ministerial Decision 148/2009</b>                            | GG 190/A/29-09-2009 | On environmental liability regarding the prevention and remediation of environmental damage |

As documented in the relevant preceding and following Sections, the methodology applied for the preparation of the present ESIA is developed in accordance with the requirements, specifications and guidelines of the national Legislative Framework, the European Directives, and the international Conventions and agreements on Environmental Impact Assessment and the achievement of the objective of environmental protection (with an emphasis on the marine environment).

#### 5.2.2.2.1 Law 4014/2011 on the Environmental Permitting of Projects and Activities

The national legislative framework was first enriched for the protection of the environment in 1986 with Law 1650/1986, which approached the first EIA Directive while also regulating a series of environmental issues that were considered quite radical for the time. The approach was rather detailed, and for the matters where a degree of flexibility was allowed for Member States, the law leaned toward stricter interpretation.

Amendments to the Directive brought changes to national legislation, which were established through Law 3010/2002. The main changes introduced included compliance with the new Directive, decentralization, and the establishment of the screening procedure. Later, the legal framework was revised with Law 4014/2011, which was accompanied by a series of JMDs, Ministerial Decisions, and Circulars, all aiming, along with the main law, at improving the overall outcome and increasing the added value of the procedures. In particular, Law 4014/2011 and *Ministerial Decision 5688/2018* (GG 988/B/21-03-2018), which amended it, introduced important fundamental improvements and changes.

The Environmental Impact Assessment process in Greece, for projects such as the proposed one, is summarized in the following phases (according to the current legislation) and is also presented diagrammatically in the flow chart that follows:

- 1 Submission of Environmental Impact Assessment Study:** The project developer submits the EIA<sup>14</sup> Study of the project to the Ministry of Environment and Energy (YPEN), Directorate of Environmental Permitting (DIPA)<sup>15</sup>.
- 2 Completeness Check:** DIPA/YPEN checks the EIA Study for completeness and may request additional information before forwarding it for consultation.

<sup>14</sup> The content of the Environmental Impact Assessment (EIA) is determined based on (a) the classification of the project (in accordance with Ministerial Decision (MD) ΔΙΠΑ/37674/27-07-2016, as amended by the following Ministerial Decisions: 2307 (GG 439/B/2018), MD ΥΠΕΝ/ΔΙΠΑ/64001/2029 (GG 4420/B/2018), MD ΥΠΕΝ/ΔΙΠΑ/94321/3907 (GG 5798/B/2018), MD ΥΠΕΝ/ΔΔΥ/24593/2902/2020 (GG 1482/B/2020), ΥΠΕΝ/ΔΙΠΑ/74463/4562 (GG 3291/B/2020), MD 92108/1045/Φ.15/2020 (GG 3833/B/2020), MD ΥΠΕΝ/ΔΙΠΑ/99398/6484/2020 (GG 4656/B/2020), ΥΑ ΥΠΕΝ/ΔΙΠΑ/17185/1069 (GG 841/B/2022), ΥΑ ΥΠΕΝ/ΔΙΠΑ/64712/4464 (GG 3636/B/2022), MD ΥΠΕΝ/ΔΙΠΑ/53510/3616 (GG 3327/B/2023), MD ΥΠΕΝ/ΔΙΠΑ/63951/4418/2024 (GG 3867/2024)) and (b) the detailed specifications set out in JMD 170225/2014 and its amendment by MD 1915/2018 and MD ΥΠΕΝ/ΔΙΠΑ/143898/9866/2024 (GG 7322/B/2024), for each type of project/activity.

<sup>15</sup> The content of the EIA Study is determined by (a) the project classification (in accordance with MD 1958/2012) and (b) the detailed specifications defined in JMD 170225/2014 for each type of project/activity.

- 3 **Institutional Consultation:** Opinion/response from Central Authorities or other competent Ministries, Regional Authorities, and other organizations<sup>16</sup>.
- 4 **Public Consultation:** The project is presented before the Regional Council during an open hearing where people may express their views.
- 5 **Decision on the Approval of Environmental Terms:** DIPA/YPEN examines the results of the consultation (institutional and public) and issues its decision, co-signed by the other competent Ministries.
- 6 **Publication of Decision:** The decision is published through the competent Regional Council.

The procedure for amending and renewing the approved Environmental Terms of Category **A1 projects** is provided for in Articles 5 and 6 respectively of Law 4014/2011, as applicable.

Figure 5-4: Flow chart of the EIA procedure according to the National Legal Framework

Regarding the consultation process for the evaluation of the EIA and the institutional information of the interested public, the provisions of JMD 1649/45/2014 apply, which define and specify the provisions of Article 19, paragraph 19 of Law 4014/2011 regarding:

- The consultation means between various authorities and
- The ways of informing the public as well as participation in the public consultation during the environmental permitting procedure.

The aforementioned JMD specifies further the consultation following the implementation of article 18, paragraph 5 of L.4014/2011 regarding the digital environmental registry. However, since a transition period

<sup>16</sup> The consultants are predetermined by JMD 1649/45/2014 for each type and category of project.

is expected until the setup of this registry, the procedures have also been specified for this period. Apart from this, the authorities to be consulted are also identified and stated in Annex B of the JMD.

This ESIA has been prepared and submitted in accordance with Law 4014/2011 on the environmental permitting of projects and activities, as amended and in force, and with the relevant secondary legislation that sets out the content, procedure and consultation requirements for Environmental Impact Assessments.

#### 5.2.2.2.2 Law 4685/2020 - Modernization of Environmental Legislation and Other Provisions

Environmental permitting in Greece, despite the amendments made to the legislation and the improved quality of studies by private consultants, remains a time-consuming administrative process and, therefore, a significant obstacle to the promotion of investments. Specifically, the environmental permitting process for new projects, which are vital for the development of the Greek economy, significantly exceeds the timeframes provided by the applicable legislation across all project categories. Additionally, the permitting process for existing investments, such as the renewal or modification of the Environmental Terms Approval (ETA) also exceeds the statutory timelines. Indicatively, in 40% of cases, new opinions are requested from competent services. As a result, existing investments are treated as new ones, incurring the corresponding delays. To accelerate and simplify the procedures to address longstanding operational problems and to create an investment-friendly environment in Greece, the provisions of Law 4685/2020 were enacted. These provisions constitute horizontal reform within the framework of EU legislation and introduce a faster, safer, and more efficient environmental permitting system. This chapter shortens and simplifies the environmental permitting process, while fully respecting environmental protection. The new regulations regarding the validity period of ETAs, as well as the process for their issuance, renewal, and modification, simplify the business environment and reduce the administrative burden on public authorities, which is further alleviated by allowing the engagement of private EIA evaluators, thus activating and strengthening a provision that had already existed under the original Law 4014/2011 (GG A' 209). The key principle underpinning this law, in terms of environmental permitting, is to relieve both public authorities and businesses of procedural burdens that do not contribute meaningfully to environmental protection.

More specifically, the main changes introduced by the new law in the field of environmental permitting are as follows:

Article 1: This provision extends the validity period of ETAs and introduces favourable conditions for Project Developers with environmental certification (EMAS and ISO 14001), as these ensure better compliance with environmental legislation and permit terms, while also providing a strong incentive to maintain environmental certification. In particular, with the amendment of point (a) of paragraph 8 of Article 2 of Law 4014/2011, the validity period of the ETA is set at fifteen years instead of the previous ten, provided that no changes occur based on the data on which the decision was issued. Additionally, the ETA validity is extended by six years for projects or activities implementing an Environmental Management System (EMS) according to the Eco-Management and Audit Scheme (EMAS), for as long as the EMS remains in effect. For projects or activities implementing an EMS according to ISO 14001 or a similar standard, the ETA validity is extended by four years. Under the previous legislation, these extensions were four years and two years respectively for EMAS and ISO 14001. These extensions are granted by a formal confirmation act. The ETA automatically expires if the renewal of the above EMS is not carried out in time during the extension period.

Additionally, the Project Developer must maintain a valid EMS for at least one year prior to the ETA renewal deadline. A notable provision in this article is that the new deadlines also apply to all ETAs in force at the time of the publication of this law.

Article 2: Due to the delays in issuing ETAs for new projects or activities in both Category A1 and Category A2, it became necessary to amend the existing legislative framework to simplify procedures, shorten timeframes, attract investors, and facilitate the responsible authorities. This provision shortens the deadlines at various stages of maintaining environmental permits. It is in line with EU law, which sets a minimum 30-day period for public consultation (Article 6, para. 7 of Directive 2011/92, as amended by Directive 2014/52), while also requiring the competent authority to decide within a maximum of 90 days from the submission of all required information by the project owner (Article 4, para. 6 of Directive 2011/92). Referral to KESPA or PESPA is established, as applicable, if essential opinions are delayed (e.g. forestry, archaeology, appropriate assessment for protected areas), so that the process is not derailed by the inaction of a single authority. Essential opinions are clarified as those from public authorities whose responsibilities are directly related to the characteristics of the project and its potential environmental impacts. To reduce delays caused by the submission of supplementary data, the provision clearly states that the submission of such data by the Project Developer, upon request from the competent environmental authority, is mandatory at any stage of the process but does not interrupt the deadlines. It is evident that the above changes significantly simplify the permitting process for both A1 and A2 category projects.

Article 8: This article establishes that, from 1 January 2021 onwards, the entire environmental permitting process is carried out through the Electronic Environmental Registry (EER), thus ensuring full transparency and faster processing. Specifically, the obligation to upload all documents related to the environmental permitting process on the EER is introduced. This obligation starts from 1.1.2021 and includes documents regarding the issuance, renewal, or modification of ETAs and PPAs, including applications, Environmental Impact Studies, opinions of administrative services, draft ETAs, and all relevant correspondence. Furthermore, all document transmission and public consultation processes (where required) are exclusively conducted through the EER. This digitization makes the transmission of permitting files and data faster and simpler, following the model of other European countries.

Regarding changes in the management of protected areas (CHAPTER C): Until now, protected areas in Greece have been managed by Protected Areas Management Bodies (PAMB), which are legal entities under private law.

To implement a new and modern governance system for Protected Areas, a comprehensive and unified planning framework was deemed necessary, through a scientific, advisory, and coordinating body for the effective organisation of governance and management of these areas. To this end, a unified body was established, the Organisation for Natural Environment & Climate Change Agency (NECCA), with a coordinating and executive role, collaborating with other competent authorities (Ministries, regional and local governments, environmental NGOs, civil society, local production bodies). The existing PAMB were incorporated into this Organisation as 24 Protected Area Management Units, functioning as departmental-level units responsible for implementing management plans at the local level.

Article 26: This article defines the Governance System for Protected Areas, which consists, at the national level, of the Ministry of Environment and Energy and the newly established N.E.C.C.A., as well as the Ministries of Interior, Rural Development, Digital Governance, Maritime Affairs and Island Policy, and Tourism.

At regional level, this system includes the Protected Area Management Units, Decentralised Administrations, Regional Governments, and Municipalities, supported by academic and research institutions, environmental organisations, and non-profit entities. This framework outlines the new model for managing protected areas through collaboration between all relevant stakeholders.

Article 27: Article 27 establishes the Organisation for Natural Environment and Climate Change (N.E.C.C.A.), into which the Legal Entity under Private Law named “National Centre for Environment and Sustainable Development” (EKPAΑ), established by Law 2742/1999 (GG A’ 207), is integrated. Furthermore, two departments are established: the Protected Area Management Department and the Climate Change Department. N.E.C.C.A. is responsible for implementing the policy defined by the Ministry of Environment and Energy regarding the management of protected areas in Greece, addressing climate change, and promoting and implementing sustainable development actions. Its main responsibilities include, among others: a) the central coordination for the implementation of strategies and policies related to the management of Protected Areas as well as Climate Change mitigation, b) the conduct of scientific research and the preparation of studies for all public entities within its areas of competence, c) the submission of reports and statements to international bodies in line with the country's obligations, and representation of Greece in international and European groups and committees. An important addition is the competence of N.E.C.C.A. to organise the special open-access web portal provided in paragraph 2 of Article 18 of Law 3937/2011 (GG A’ 60), through which all available information on the conservation status and protection regime of Greek biodiversity is published. This includes the collection of scientific information and reliable statistical data from all involved stakeholders, including data derived from Environmental Impact Assessments (EIAs) and Environmental Permitting Studies (EPS), which are then structured into an appropriate infrastructure of thematic and spatial databases concerning protected areas. A critical responsibility of N.E.C.C.A. is the issuance of opinions for the appropriate assessment of the impacts of any project and/or activity in the protected areas under its jurisdiction, in cases where the integrity of the area and its protected assets may be affected. This competence is activated, in accordance with paragraph 8 of Article 43, following the partial staffing of the Organisation.

Article 34: Article 34 provides the establishment of 24 Protected Area Management Units, operating at the departmental level. These Units are the evolution of the former Protected Area Management Bodies and are integrated into the hierarchical structure of N.E.C.C.A. In this way, the issue of lack of coordination among the former Management Bodies is addressed, while also serving the need to connect the Central Organisation with local structures. The management of protected areas must be carried out on two levels: a central, operational, and administrative level, and a local level. Simultaneously, with the coordination and logistical support of the Central Organisation, the Regional Units will be better positioned to participate in and attract additional funding from European Programs. Among other responsibilities, the Units are tasked with implementing and monitoring the management plans of the protected areas within their territorial jurisdiction, monitoring the species and habitat types of Community interest in these areas, and conducting consultations with local communities, production stakeholders, and any other relevant entities, whenever necessary, with the aim of integrated management, effective protection, and showcasing the values of the protected areas. They are also responsible for integrating environmental considerations into local development standards and programs, raising public and stakeholder awareness on issues related to the objectives and mission of the Management Units, organising and participating in training and education programs, as well as conferences, workshops, seminars, and other outreach events to promote and highlight

the goals of protected area management. Furthermore, they participate in local fire prevention planning within their areas of responsibility, in cooperation with the Ministry of Environment and Energy and the Ministry of Citizen Protection.

This ESIA has been prepared in line with the environmental permitting procedures of Law 4685/2020, as amended and in force.

### 5.2.2.2.3 Integration of Climate Law into Impact Assessment

The latest and very significant update on the national impact assessment framework has been Ministerial Decision ΥΠΕΝ/ΔΙΠΑ/143898/9866/2024 (GG B' 7322/31.12.2024), which serves as implementing regulation that operationalizes Article 18 of the Climate Law. This regulation modifies the content requirements of Environmental Impact Assessments (EIAs / ΜΠΕ) for Category A projects under Law 4014/2011 by bringing into force the provisions of Article 18 that included:

Article 18 introduced a new climate dimension into environmental permitting. It required EIAs to include:

1. Assessment of a project's impact on climate
  - Quantification of direct and indirect greenhouse-gas (GHG) emissions from construction and operation.
  - Assessment of how the project contributes to or affects national and EU climate objectives and the National Energy and Climate Plan (NECP/ΕΣΕΚ).
2. Assessment of climate vulnerability
  - Evaluation of how climate change (heat, flooding, drought, wildfire risk, sea-level rise, etc.) could affect the project.
  - Identification of adaptation and resilience measures.
3. Compatibility check with climate-neutrality goals
  - Examination of whether the project aligns with Greece's emissions-reduction pathway and the 2050 climate-neutrality objective.

In a nutshell, the amendment implemented Article 18 of Greece's National Climate Law by making climate mitigation and climate-resilience assessments a mandatory and structured part of Environmental Impact Assessments for major projects (Category A), thereby integrating climate considerations directly into the environmental permitting system.

Compliance with the requirements of Article 18 of Law 4936/2022, as implemented through Ministerial Decision ΥΠΕΝ/ΔΙΠΑ/143898/9866/2024, is addressed through the Project greenhouse gas assessment, climate vulnerability assessment and climate adaptation measures presented in the relevant chapters of this ESIA.

### 5.2.2.3 Directive 2001/42/EC on the assessment of the effects of certain plans and programmes on the environment (SEA Directive)

*Directive 2001/42/EC (SEA Directive)* establishes the framework for assessing the environmental effects of certain plans and programmes prior to their adoption, ensuring that environmental considerations are integrated into strategic decision-making. The Directive requires the preparation of an environmental report, consultation with authorities and the public, consideration of alternatives, and monitoring of environmental effects. In Greece, the Directive has been transposed through *JMD 107017/2006 (GG B' 1225/2006)*. While the Directive does not apply directly to individual offshore exploration projects, it is relevant to the strategic plans and programmes that may provide the planning framework within which such projects are developed.

### 5.2.2.4 National Legislation for Strategic Environmental Assessment (SEA)

*JMD 107017/2006 (GG B' 1225/2006)* transposes Directive 2001/42/EC (SEA Directive) into Greek legislation and establishes the national framework for the Strategic Environmental Assessment of plans and programmes likely to have significant environmental effects. The Decision sets out procedures for screening, scoping, preparation of an Environmental Report, consultation, consideration of alternatives, and environmental monitoring. Although it does not apply directly to individual offshore exploration projects, it provides the strategic environmental assessment framework for plans and programmes that may influence the development and authorisation of such projects.

Annexes I–III of *JMD 107017/2006*, establish the types of plans and programmes subject to Strategic Environmental Assessment (SEA) and the minimum content of a Strategic Environmental Impact Assessment (SEIA) Report.

Annex I of *JMD 107017/2006* identifies the plans and programmes that require a Strategic Environmental Assessment (SEA). These include operational programmes co-financed by the European Union, national and regional spatial planning frameworks, regulatory and urban development plans, integrated tourism development areas, water resources management plans, regional waste management plans, hazardous waste management plans, land reclamation and water resources development plans, and tourism port development programmes.

Annex II establishes the screening criteria for determining whether other plans and programmes require SEA. Screening applies to plans that establish a framework for future development consent of projects, define the use of small areas at the local level, constitute minor modifications to existing plans, or provide the framework for projects falling within the categories of the national environmental permitting legislation.

Annex III specifies the minimum content of the Strategic Environmental Impact Assessment (SEIA) Report. The report must include:

- a non-technical summary.
- information on the planning authority and the SEA preparer.
- the objectives of the plan or programme and its relationship with international, European Union, national, and other relevant plans and environmental objectives.
- a description of the plan or programme, including its geographical scope and the projects or activities it may enable.

- an assessment of reasonable alternatives, including the "do-nothing" scenario.
- a description of the existing environmental baseline and likely future evolution without implementation of the plan.
- identification of environmentally sensitive areas, including Natura 2000 sites.
- an assessment of the likely significant environmental effects, including direct, indirect, cumulative, synergistic, short-, medium-, and long-term, permanent and temporary, positive and adverse impacts on biodiversity, population, human health, fauna, flora, soil, water, air, climate, material assets, cultural heritage, landscape, and the interactions between these factors.
- measures to avoid, minimise, or mitigate significant adverse environmental effects;
- an environmental monitoring programme; and
- the environmental conditions and monitoring requirements to be incorporated into the environmental approval decision.

For the specific offshore exploration well, there are SEA requirements that emerge from strategic plans, programmes and regulatory documents that apply to Offshore Hydrocarbon Exploration and Exploitation Areas in the Ionian Sea area and establish the wider framework for this and other relevant neighboring projects (for example, marine spatial plans, offshore licensing plans, or regional spatial planning frameworks).

#### 5.2.2.5 Directive 2008/98/EC on Waste and Repealing Certain Directives (Waste Framework Directive)

---

The Waste Framework Directive provides the primary legislative framework for the collection, transport, recovery, and disposal of waste. Waste is defined as "any substance or object which the holder discards or intends or is required to discard", while "waste treatment" is defined as "any recovery or disposal operation, including preparation prior to recovery or disposal". According to the Waste Framework Directive, a distinction must be made between:

- The temporary storage of waste pending its collection,
- The collection of waste, and
- The storage of waste pending treatment.

The Directive clarifies that installations or undertakings that merely collect waste generated by their own activities should not automatically be considered engaged in waste management and therefore do not require a separate permit for storage pending collection.

Further distinguishing between collection and treatment, it is noted that "the temporary storage of waste included in the definition of collection refers to the activity of storing waste pending its collection at facilities where it is unloaded, with the purpose of preparing it for further transport to recovery or disposal elsewhere". Regarding the objective of this Directive, a distinction must be made between temporary storage of waste pending collection and storage of waste pending treatment, depending on the type of waste, the scale and duration of storage, and the purpose of collection.

The storage of waste prior to recovery for a period of three years or more, and the storage of waste prior to disposal for a period of one year or more, are subject to Directive 1999/31/EC of the Council of 26 April 1999 on the landfill of waste.

It should be noted that Article 2, paragraph (2), point (d) of the Waste Framework Directive provides that, insofar as they are covered by other EU legislation, "waste resulting from prospecting, extraction, treatment and storage of mineral resources and the working of quarries which is covered by Directive 2006/21/EC" is excluded from the scope of the Directive. Nevertheless, according to Article 2, paragraph (2), point (b) of Directive 2006/21/EC on the management of waste from extractive industries (and amending Directive 2004/35/EC), "waste resulting from offshore prospecting, extraction and treatment of mineral resources" (emphasis added by the author) is excluded from the scope of that Directive.

As a result, since the waste produced at offshore installations (and transported onshore) is not covered by the more specific Directive concerning extractive industry waste, operators of offshore oil and gas installations must comply with the requirements of the more general Waste Framework Directive. This means that the "original waste producer or other holder" (in practice: the operator) will be required to carry out the treatment of waste themselves or to assign the treatment to a waste collector, agent, or establishment or undertaking carrying out waste treatment operations, in accordance with Articles 4 and 13 (Article 15 paragraph (1)).

The Project's waste management arrangements have been designed in accordance with the requirements of Directive 2008/98/EC, as transposed into Greek law, including application of the waste hierarchy, safe handling practices and the use of licensed waste contractors. Waste management will be implemented in accordance with the Waste Management Plan (WMP) accompanying this ESIA, which specifies the procedures for collection, temporary storage, transfer and treatment of project-generated waste.

#### 5.2.2.6 Convention on Environmental Impact Assessment in a Transboundary Context (Espoo Convention)

The Convention on Environmental Impact Assessment in a Transboundary Context, commonly known as the Espoo Convention, was adopted in Espoo, Finland, on 25 February 1991 and entered into force on 10 September 1997. It establishes an international procedural framework for assessing the environmental effects of proposed activities that may cause significant adverse impacts beyond the jurisdiction of the State in which they are planned (United Nations Economic Commission for Europe [UNECE], 1991)<sup>17</sup>.

The Convention requires the Party of origin, namely the State under whose jurisdiction a proposed activity is planned, to take all appropriate and effective measures to prevent, reduce and control significant adverse transboundary environmental impacts. For activities listed in Appendix I that are likely to cause such impacts, an Environmental Impact Assessment must be undertaken before a decision is made to authorise or commence the proposed activity (UNECE, 1991, Arts. 2–3).

<sup>17</sup> United Nations Economic Commission for Europe. (1991). *Convention on environmental impact assessment in a transboundary context*. United Nations, <https://unece.org/environmental-policy/convention-environmental-impact-assessment-transboundary-context-espoo-0>

Official Journal of the European Communities. (1992). *Convention on environmental impact assessment in a transboundary context*. Official Journal of the European Communities, L 104, 7–27, [https://eur-lex.europa.eu/legal-content/EN/TXT/PDF/?uri=CELEX:21992A0424\(04\)](https://eur-lex.europa.eu/legal-content/EN/TXT/PDF/?uri=CELEX:21992A0424(04))

Where a proposed activity may result in significant adverse transboundary impacts, the Party of origin must notify any potentially affected Party as early as possible and no later than the time at which its own public is informed. The notification should include information on the proposed activity, the nature of the possible decision and a reasonable timeframe within which the affected Party may indicate whether it intends to participate in the environmental assessment procedure (UNECE, 1991, Art. 3).

The Convention also requires the authorities and the public in the areas likely to be affected to be informed and given an opportunity to comment on the proposed activity and its potential environmental effects. The Party of origin must ensure that the public of the affected Party is provided with opportunities equivalent to those available to its own public. Comments submitted by the affected Party's authorities and public must be transmitted to the competent authority of the Party of origin before the final decision is taken (UNECE, 1991, Arts. 2–4).

Following the preparation and distribution of the Environmental Impact Assessment documentation, the Parties concerned must enter consultations without undue delay. These consultations may address possible alternatives, measures to avoid, reduce or mitigate significant adverse transboundary impacts, environmental monitoring and other forms of cooperation relating to the proposed activity. The Parties must agree on a reasonable timeframe for the duration of the consultation process (UNECE, 1991, Art. 5).

The final decision on the proposed activity must take due account of the Environmental Impact Assessment documentation, the comments received from the affected Party's authorities and public and the outcome of the transboundary consultations. The Party of origin must provide the affected Party with the final decision and the reasons and considerations on which it was based. Where material new information becomes available before the activity commences, the Parties may consult on whether the decision should be reviewed or revised (UNECE, 1991, Art. 6).

The Convention also provides for post-project analysis where the Parties concerned consider it necessary. Such analysis may be used to monitor compliance with the conditions attached to the authorisation, review the effectiveness of mitigation measures, verify impact predictions and identify any unforeseen significant adverse transboundary impacts. Where post-project analysis identifies an impact that may result in a significant adverse transboundary effect, the Parties must consult on the measures required to reduce or eliminate that impact (UNECE, 1991, Art. 7).

The ESIA has been prepared in a manner consistent with the principles of the Espoo Convention and includes the identification, assessment and management of potential environmental and social impacts, including those that could extend beyond national boundaries. Given the offshore and onshore setting of the Project, the ESIA has considered potential transboundary impact pathways, including effects on the marine environment, biodiversity, fisheries, navigation, air emissions and accidental events.

The ESIA includes screening and assessment of potential transboundary impacts and supports the application of the Espoo Convention procedures where significant transboundary effects are identified by the competent authorities.

According to the ESIA, normal operations are not expected to cause significant transboundary effects, and only rare, high-impact accident scenarios could lead to such impacts. These scenarios have been identified and assessed, and their possible cross-border effects have been considered in the impact assessment and in the Project's emergency response and oil spill contingency plans. Where screening indicates the likelihood of significant transboundary effects, or where a potentially affected State requests participation, the relevant

authorities will apply the formal transboundary notification and consultation procedure in line with the Espoo Convention and the EU ESIA Directive. This approach ensures that affected States and their public have timely access to ESIA documentation and a genuine opportunity to comment before final decisions are made.

## 5.2.3 Legislative framework for the prevention of marine pollution

### 5.2.3.1 Directive on the safety of offshore oil and gas operations (2013/30/EU)

Following the Deepwater Horizon incident in the Gulf of Mexico in April 2010, the European Commission expressed its initial views on the safety of offshore oil and gas operations in its communication entitled "Facing the Challenge of the Safety of Offshore Oil and Gas Activities" (published on 13 October 2010).

The European Commission's communication concluded that the existing divergent and fragmented regulatory framework governing the safety of offshore oil and gas operations in Europe, as well as the recent safety practices within the industry, did not sufficiently ensure the minimization of risks from offshore accidents across the Union.

On 28 June 2013, the European Commission published the Offshore Safety Directive. The purpose of this Directive is to reduce as much as possible the occurrence of major accidents related to offshore oil and gas operations and to limit their consequences.

According to Directive 2013/30/EU, the EU has established a set of rules, as summarized below, to help prevent accidents as well as to ensure a prompt and effective response in the event of an incident.

- Before commencing exploration or production, companies must prepare a Report on Major Hazards (RoMH) for their offshore installation. This report must include a risk assessment and an emergency response plan.
- Companies must ensure the availability of the necessary resources so that they can be deployed if needed.
- When granting licenses, EU countries must ensure that companies are financially sound and possess the necessary technical expertise.
- Operators' drilling programs and designs must be independently verified to ensure the required safety levels. This verification must take place before drilling operations commence.
- National Authorities must verify compliance with safety regulations, environmental protection measures and the preparedness of both production and non-production facilities for emergency situations. If companies fail to meet the minimum standards, EU countries may impose sanctions, including the suspension of operations.
- Information regarding how companies and EU countries maintain the safety of installations should be made available to the public.
- Companies will bear full responsibility for any environmental damage caused to protected marine species and natural habitats.

To further promote offshore safety, the European Commission collaborates with its international partners on implementing the highest safety standards worldwide. Inspectors of offshore installations from EU countries

also cooperate with the European Union Offshore Oil & Gas Authorities Group (EUOAG) to exchange best practices and improve standards.

The Asopus-1 exploration well has been planned in accordance with Directive 2013/30/EU, implemented in Greece via Law 4409/2016. This involved the preparation of a Report on Major Hazards, a Notification of Well Operations, a Safety and Environmental Management System, and project-specific emergency and oil spill response plans. Along with the Quantitative Risk Assessment (ORA) in Chapter 9, the Emergency Response Plan (ERP), which will be formally submitted to the regulatory authority(ies) for approval as required, illustrate how major accident risks and pollution prevention are addressed for the Project.

### 5.2.3.2 National Law 4409/2016 for the framework for safety in offshore hydrocarbon exploration and exploitation operations, transposition of Directive 2013/30/EU, amendment of Presidential Decree 148/2009, and other provisions

Directive 2013/30/EU on the safety of offshore oil and gas operations is transposed into Greek law primarily through Law 4409/2016 (GG A' 136/28.07.2016) "Framework for safety in offshore hydrocarbon exploration and exploitation operations, transposition of Directive 2013/30/EU, amendment of Presidential Decree 148/2009, and other provisions", which establishes a comprehensive offshore safety and environmental risk management regime for hydrocarbon activities in Greek waters. This law introduces detailed requirements for operators of offshore installations, including the obligation to prepare and submit major hazard reports, implement certified safety and environmental management systems, conduct systematic risk assessments, and maintain fully operational emergency response and oil spill contingency plans. It also establishes stricter rules for the design, construction, operation, and decommissioning of offshore facilities, ensuring that all activities are subject to continuous technical oversight and preventive safety controls aimed at avoiding major accidents. On the institutional level, the law strengthens the role of the national competent authority (today the Hellenic Hydrocarbon and Energy Resources Management Company – HEREMA / ΕΔΕΥΕΠ) as the designated offshore safety competent authority responsible for licensing safety documentation, conducting inspections, monitoring compliance, and enforcing corrective measures where necessary. It further requires financial capability and liability coverage from operators to ensure that any environmental damage or industrial accident can be adequately addressed. In combination with Law 2289/1995, which establishes the State ownership of hydrocarbons and the concession-based exploration and production system, and Law 4001/2011, which modernises energy market regulation and institutional supervision, Law 4409/2016 completes the regulatory architecture by embedding EU-level offshore safety standards into Greek hydrocarbons law. The result is a multi-layered legal system in which exploration and production rights are granted under strict environmental, technical, and safety conditions, with continuous State oversight and full alignment with the requirements of Directive 2013/30/EU, particularly regarding accident prevention, operator accountability, and protection of marine ecosystems.

The proposed Asopus-1 exploration well has been planned in accordance with Law 4409/2016, which transposes Directive 2013/30/EU, and includes Major Hazard Report / NoWO submissions, a Safety and Environmental Management System, and project-specific emergency response and oil spill contingency plans. It is therefore considered consistent with the Directive's safety and environmental requirements.

### 5.2.3.3 Water Framework Directive (WFD) 2000/60/EC

The Water Framework Directive (Directive 2000/60/EC of the European Parliament and of the Council of 23 October 2000) was adopted to establish a framework for Community action in the field of water policy. Member States commit to achieving good qualitative and quantitative status of their waters (including marine waters up to 1 nautical mile from the coast). It is considered a framework directive because it outlines the necessary steps to reach a common objective, rather than adopting the more traditional approach of fixed limit values. The Directive aims to achieve “Good” overall status for all groundwater and surface waters (rivers, lakes, transitional and coastal waters) within the EU. The WFD integrates qualitative, ecological, and quantitative objectives for the protection of aquatic ecosystems and the good status of all water resources, introducing the concept of integrated management at the scale of River Basin Districts (RBDs).

Furthermore, it redefines the concept of the RBD to include inland surface waters (rivers, lakes), groundwater, transitional (deltas, river estuaries), and coastal ecosystems. The ecological and chemical status of surface water bodies is assessed based on the following criteria:

- **Biological** quality elements (such as fish fauna, benthic invertebrates, and aquatic flora).
- **Hydromorphological** quality elements, including features like riverbank structure or the substrate of the riverbed.
- **Physicochemical** quality elements, such as temperature conditions, dissolved oxygen levels, and nutrients.
- **Chemical quality**, referring to Environmental Quality Standards (EQS) for specific pollutants within a river basin. These standards define maximum allowable concentrations for certain substances. If even one of these limits is exceeded, the water body cannot be classified as having “good ecological status.”

The standards and threshold values define the applicable classes for each quality characteristic and are set out in the WFD Guidelines (2016). In addition, Article 6 of the WFD requires the establishment of a register or registers of all areas within River Basin Districts (RBDs) that are designated as areas of special protection under specific Union legislation, either for the protection of surface and groundwater or for the conservation of habitats and species directly dependent on water. The WFD was amended by Directive 2008/105/EC concerning environmental quality standards in the field of water policy.

The harmonization of national legislation with the Water Framework Directive (WFD) was achieved through Law 3199/2003, Presidential Decree 51/2007, and JMD H.Π. 51354/2641/E103/2010. The provisions of this legislation incorporate the core principles of the WFD, defining the administrative structure and responsibilities of the involved parties at both national and regional levels. Within this framework, the competent authority (General Directorate for Water of the Ministry of Environment and Energy) has approved the 2nd Revision of the River Basin Management Plans (RBMPs) for the 14 River Basin Districts of the country, in accordance with the WFD and national legislation.

The study area that is associated with the onshore facilities falls within Water Districts EL05 "Epirus" where the 2nd Revision of the River Basin Management Plan (RBMPs) for this district was approved by GG A 71/17.05.2024. Based on the proposed mitigation measures and environmental monitoring programme (Chapters 12 and 13), the Project is not expected to cause deterioration in the status of water bodies in Water District EL05 'Epirus' and is considered consistent with the objectives of the Water Framework Directive and the 2nd Revision of the RBMP for this district.

#### 5.2.3.4 Marine Strategy Framework Directive (MSFD), 2008/56/EC

The Marine Strategy Framework Directive (Directive 2008/56/EC) was adopted on 17 June 2008 after many years of preparation and extensive consultation with all stakeholders and the public, and it came into force on 15 June 2008. The Directive aims to achieve **Good Environmental Status (GES)** of the EU's marine waters by 2020 and to protect the resources on which marine economic and social activities depend. It is the EU's first legal instrument related to the protection of marine biodiversity, as it includes the specific regulatory objective of “maintaining biodiversity by 2020” as a cornerstone for achieving Good Environmental Status in marine waters. The Directive establishes within a legislative framework the ecosystem-based approach to managing human activities that impact the marine environment, integrating the concepts of environmental protection and sustainable use. To achieve its objective, the Directive establishes European marine regions and subregions based on geographic and environmental criteria. Specifically, the Directive distinguishes four European marine regions – the Baltic Sea, the Northeast Atlantic Ocean, the Mediterranean Sea, and the Black Sea – all located within the geographic boundaries of existing regional sea conventions. Cooperation among Member States within a marine region, as well as with neighboring countries sharing the same marine waters, already takes place through these Regional Sea Conventions.

To achieve Good Environmental Status (GES) by 2020, each Member State (MS) is required to develop a strategy for its marine waters (Marine Strategy). Furthermore, since the Directive follows an adaptive management approach, Marine Strategies must be updated and revised every 6 years. In this context, the Commission developed a set of detailed criteria and methodological standards to assist Member States in implementing the MSFD. These criteria and methodological standards were revised in 2017, leading to the new Commission Decision on Good Environmental Status. Annex III of the Directive was also amended in 2017 (Directive 2017/845/EU) to better link the components of ecosystems, anthropogenic pressures, and impacts on the marine environment with the 11 qualitative descriptors of the MSFD and the new decision on Good Environmental Status.

#### 5.2.3.5 Law 3983/2011 for the National Strategy for the Protection and Management of Marine Environment - Harmonization with Directive 2008/56/EC

The MSFD was incorporated into national legislation through Law 3983/2011, as amended by JMD YPEN/DNEP/50529/2779/2018 (amending Annex III in accordance with Directive 2017/845/EU), which established the following qualitative descriptors for determining Good Environmental Status (GES) in the waters of the marine sub-region of the Aegean Sea – Eastern Mediterranean (Levantine Sea):

1. Biodiversity is maintained. The quality and extent of habitats, as well as the distribution and abundance of species, are consistent with prevailing physiographic, geographic, and climatic conditions.
2. The introduction of non-indigenous species due to human activities occurs at levels that do not adversely alter ecosystems.
3. Populations of all commercially exploited fish, mollusks, and crustaceans are within biologically safe limits.

4. All elements of the marine food webs, to the extent that they are known, exist in conditions of normal abundance and diversity, and at levels capable of ensuring the long-term abundance of species and the maintenance of their full reproductive capacity.
5. Anthropogenic eutrophication is minimized.
6. The integrity of the seabed is such that the structure and functions of ecosystems are ensured, with benthic ecosystems not being negatively affected.
7. Permanent alteration of hydrographic conditions does not adversely affect marine ecosystems.
8. Pollutant concentrations are at levels that do not cause impacts.
9. Pollutants in fish and other seafood intended for human consumption do not exceed the limits set by Community legislation or other equivalent standards.
10. The properties and quantities of waste in the sea do not cause harm to the coastal and marine environment.
11. The import of energy, including underwater noise, is at levels that do not adversely affect the marine environment.

The corresponding Environmental Objectives and Indicators for each qualitative descriptor parameter were established through JMD 1175/2012 (see the following table), while JMD 142569/2017 established the Programme of Measures for achieving or maintaining Good Environmental Status (GES) in accordance with Article 12 of Law 3983/2011.

**Table 5-7: National Environmental Objectives for achieving Good Environmental Status (GES) in the marine sub-region of the Aegean Sea – Eastern Mediterranean (Levantine Sea) within the framework of the MSFD (JMD 1175/2012)**

| QUALITATIVE DESCRIPTOR PARAMETER | ENVIRONMENTAL OBJECTIVES                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>1</b>                         | <p>Conservation of the population of the Mediterranean monk seal (<i>Monachus monachus</i>) in Greek waters.</p> <p>Census of the population of the loggerhead sea turtle (<i>Caretta caretta</i>) breeding on Greek coasts and conservation of nesting areas.</p> <p>Conservation and mapping of <i>Posidonia oceanica</i> seagrass meadows.</p> <p>Census of the extent occupied by biogenic sediments of the Maerl type.</p> <p>Conservation of benthic macrofauna communities and the structure of planktonic communities.</p> |
| <b>2</b>                         | Census of invasive alien species and their environmental impacts on marine ecosystems.                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>3</b>                         | <p>Monitoring of the indicators “Fishing Mortality” (F/F<sub>msy</sub>) and “Spawning Biomass” (B/B<sub>msy</sub>) for representative benthopelagic species.</p> <p>Monitoring of the “Fishing Exploitation” indicator for representative pelagic species.</p> <p>Correlation of fishing activities with the established indicators.</p>                                                                                                                                                                                           |
| <b>4</b>                         | Monitoring and assessment of the biomass balance at higher trophic levels relative to the total catch of benthopelagic fish.                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>5</b>                         | <p>Reduction of organic load and nutrients entering the marine environment from point and non-point sources.</p> <p>Reduction of nitrate pollution from agricultural activities.</p>                                                                                                                                                                                                                                                                                                                                               |
| <b>6</b>                         | <p>Mapping of sensitive benthic habitats.</p> <p>Maintenance of the balance of benthic macrofauna.</p>                                                                                                                                                                                                                                                                                                                                                                                                                             |

| QUALITATIVE DESCRIPTOR PARAMETER | ENVIRONMENTAL OBJECTIVES                                                                                                                                                              |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 7                                | Prevention of environmental impacts from locally occurring, anthropogenic permanent alterations of hydrographic conditions.                                                           |
| 8                                | Specification of the impacts of pollutants and determination of prevailing concentration trends of these substances in the water column, sediments, marine organisms, and ecosystems. |
| 9                                | Maintenance of pollutant levels in fish and other seafood intended for human consumption within permissible limits.                                                                   |
| 10                               | Reduction of anthropogenic waste on the coasts and in the marine environment.                                                                                                         |
| 11                               | Control of energy levels to prevent adverse effects on the marine environment.                                                                                                        |

According to Article 11 of the MSFD, Greece is obliged to present a set of monitoring activities (monitoring programs) in its marine territorial waters to meet the requirements of the 11 parameters of Good Environmental Status (GES).

Monitoring programs under the MSFD framework are a combination of new and existing monitoring activities derived from other legal obligations of Member States (MS), such as monitoring of marine areas within the Natura 2000 network for the implementation of the Habitats and Birds Directives (HD and BD), monitoring of coastal water bodies under the Water Framework Directive (WFD), and the Data Collection Framework for Fisheries (DCF - COM 199/2008) for the implementation of the EU Common Fisheries Policy regulations (COM 1380/2013).

Based on the proposed mitigation measures and the environmental monitoring programme in Chapters 11 and 12, the Project is not expected to compromise Good Environmental Status (GES) in the affected marine area and is considered consistent with the objectives and provisions of Law 3983/2011, which transposes the MSFD.

### 5.2.3.6 Environmental Liability Directive (ELD) (2004/35/EC)

The Environmental Liability Directive (ELD) 2004/35/EC came into force in 2009. Unlike Directive 96/82/EC (Seveso II Directive), which applies to large high-risk installations, the Environmental Liability Directive applies to operators of certain occupational activities, regardless of company size, including those active in the energy sector, as defined in Annex III of the Directive.

The ELD defines environmental damage as:

- Damage that significantly affects the environmental (ecological, chemical, or quantitative) status of water resources, as defined in the EU Water Framework Directive and the Marine Strategy Framework Directive
- Damage to soil, which creates a serious risk to human health.
- Damage to protected species and natural habitats, which negatively impacts their conservation status, as defined in the Birds Directive and the Habitats Directive.

The above definition of environmental damage, as outlined in the Environmental Liability Directive (ELD)

2004/35/EC, includes the emission of pollutants into the atmosphere, as these can affect the condition of soil or water bodies. It also encompasses discharges into inland surface waters, groundwater, and any deliberate release of genetically modified organisms (GMOs) into the environment, in accordance with Directive 2001/18/EC.

The ELD applies to waters governed by the Water Framework Directive 2000/60/EC, which defines "surface waters" to include territorial waters. Consequently, environmental liability may be assigned for any damage occurring within 12 nautical miles from the coastline.

However, there are specific exceptions to the scope of this directive. These include environmental damage caused by armed conflicts or natural disasters, as well as types of damage already covered by international conventions (such as marine pollution). Furthermore, nuclear risks fall outside the ELD's remit, as they are regulated under the Euratom Treaty.

Regarding preventive and remedial actions, the Environmental Liability Directive (ELD) establishes the following obligations:

- If there is an imminent threat of environmental damage, the operator must immediately take the necessary preventive measures.
- If damage has already occurred, the operator is required to promptly notify the competent authorities and take appropriate actions to manage the situation. This includes preventing further environmental harm and risks to human health, as well as implementing suitable remediation measures to restore the affected environment.

The Environmental Liability Directive (ELD) was amended by Directives 2006/21/EC, 2009/31/EC, 2013/30/EU and Regulation 2019/1010. It was transposed into national legislation through Presidential Decree 148/2009.

The Project has been designed and assessed in accordance with the requirements of the Environmental Liability Directive, as transposed into Greek law through Presidential Decree 148/2009. This includes measures to prevent significant environmental damage and procedures for notification, control and remediation should such damage occur. The Project is therefore considered consistent with the requirements of the Directive.

#### 5.2.3.7 Directive 2009/123/EC, which amends Directive 2005/35/EC on ship-source pollution and the introduction of penalties, including criminal penalties for infringements, aims to strengthen the legal framework addressing illegal discharges of polluting substances

The purpose of the Directive was to incorporate international standards on ship-source pollution into EU law and to ensure that those responsible for the discharge of polluting substances are subject to appropriate penalties, including criminal sanctions. The aim is to improve maritime safety and to strengthen the protection of the marine environment from ship-generated pollution. The Directive does not prevent Member States from adopting stricter measures against ship-source pollution, provided they are consistent with international law. According to Article 3 of the Directive, it applies—in accordance with international law—to the discharge of polluting substances in:

- Internal waters of a Member State, including ports, to the extent that the MARPOL regime applies,

- Territorial waters of a Member State
- Straits used for international navigation and subject to the regime of transit passage, as defined in Part III, Section 2 of the 1982 United Nations Convention on the Law of the Sea, provided that these straits fall under the jurisdiction of a Member State,
- the exclusive economic zone or equivalent zone of a Member State, established in accordance with international law and
- the high seas.

The Directive applies to discharges of polluting substances from any ship, regardless of flag, except for warships, auxiliary warships, or other government-owned or operated ships used temporarily only for governmental, non-commercial purposes. Member States must ensure that discharges of polluting substances from ships, including minor cases of such discharges, in any of the aforementioned areas, are considered violations when committed intentionally, through conscious negligence, or gross negligence. Each Member State shall take the necessary measures to ensure that any natural or legal person who has committed an infringement as defined in Article 3 paragraph 1 can be held responsible. The discharge of polluting substances in any of the aforementioned areas shall not be considered an infringement if it meets the conditions specified in Annex I, Regulations 15, 34, 4.1 or 4.3, or in Annex II, Regulations 13, 3.1.1 or 3.1.3 of MARPOL 73/78. The discharge of polluting substances in areas (c), (d), and (e) shall not be considered an infringement for the shipowner, the master, or the crew, provided that it meets the conditions of Annex I, Regulation 4.2 or Annex II, Regulation 3.1.2 of MARPOL 73/78.

The Directive was incorporated into national legislation through Law 4037/2012.

The Project's vessel operations are designed to prevent illegal ship-source discharges, in line with MARPOL and Greek legislation implementing Directive 2005/35/EC and 2009/123/EC.

### 5.2.3.8 The Bathing Water Directive (2006/7/EC)

The Bathing Water Directive was initially enacted in 1975, and its main objective is to ensure public health and protect the aquatic environment of coastal and inland areas from pollution. Bathing waters can be coastal or inland (rivers, lakes), and they are subject to the Directive, its mandatory quality standards, and associated monitoring and information requirements only where bathing is expressly authorized or, although not prohibited, is traditionally practiced by a large number of people. The bathing season in the EU generally extends from late May to late September. The original Directive was replaced by the new Bathing Water Directive 2006/7/EC, which updates the measures of the 1975 legislation and simplifies management and monitoring methods. The new directive also provides a more proactive approach to informing the public about water quality by using four quality categories for bathing waters: "poor," "sufficient," "good," and "excellent".

The new Bathing Water Directive was incorporated into national legislation through JMD 8600/416/E103/2009 for the management of bathing waters, in compliance with the provisions of Directive 2006/7/EC. Within this framework, the competent Special Secretariat for Waters (SSW/MEECC) created the Register of Bathing Beaches to describe and present the main characteristics of bathing beaches, identify sources of pollution that may affect the quality of bathing waters, and assess the extent of these

impacts. The Register also serves as a guide for selecting appropriate measures to minimize pressures on bathing waters and to manage resources more effectively.

The Asopus-1 exploration well is located offshore, away from designated bathing waters, and is not expected to affect bathing water quality. The applicable provisions of the Bathing Water Directive, as implemented in Greek legislation, have been considered in the assessment of potential coastal water impacts.

### 5.2.3.9 Convention for the protection of the mediterranean sea against pollution (Barcelona Convention)

The Convention for the Protection of the Mediterranean Sea against Pollution (Barcelona Convention) was adopted on February 16, 1976, during a conference of Mediterranean coastal states held in Barcelona. During this conference, two Protocols were adopted aimed at preventing pollution from ships and aircraft (dumping) and at cooperation to combat pollution in emergency situations. These legal instruments came into force on February 12, 1978. The Convention also provided for the establishment of additional legal tools and was soon supplemented by the Protocol on Pollution from Land-Based Sources (1980), the Protocol on Specially Protected Areas (1982), and the Offshore Protocol (1994).

The main objectives of the Convention are:

- The assessment and control of marine pollution.
- The assurance of sustainable management of natural marine and coastal resources
- The integration of the environment into economic and social development.
- The protection of the marine environment and coastal zones through the prevention and reduction of pollution, and, as far as possible, the elimination of pollution, whether of marine or land-based origin.
- The protection of natural and cultural heritage.
- The strengthening of solidarity among the coastal States of the Mediterranean.
- The contribution to the improvement of quality of life.

In 1995, the Contracting Parties adopted significant amendments to the 1976 Convention, which was renamed the Convention for the Protection of the Marine Environment and the Coastal Region of the Mediterranean and came into force in 2004. Additionally, in 1995, the Contracting Parties adopted the Action Plan for the Protection of the Marine Environment and the Coastal Region of the Mediterranean (Mediterranean Action Plan – MAP, Phase II), replacing the original MAP adopted in 1975. The Barcelona Convention activated a total of seven Protocols concerning specific aspects of Mediterranean environmental conservation, complementing the legal framework of the MAP. These are:

- Dumping Protocol: Protocol for the prevention of pollution of the Mediterranean from the dumping of waste and other materials from ships and aircraft (approved in 1976, amended in 1995, and its amendments have not yet entered into force).
- Protocol for Land-Based Sources (LBS Protocol): (including Regional Plans under Article 15 of the LBS), which entered into force in 2011: Protocol for the Protection of the Mediterranean Sea against Pollution from Land-Based Sources and Activities, which entered into force in 1980 and was amended in 1996, with the amendment entering into force in 2008. Regional Plans were also adopted under the LBS Protocol for the reduction or elimination of substances or their loads, as well as marine litter.

- SPA Protocol: Protocol concerning Specially Protected Areas and Biological Diversity in the Mediterranean (SPA Protocol), adopted in 1995, replacing the corresponding protocol of 1982, along with its Annexes (as adopted in 1996 and amended in 2009, 2012, and 2013).
- Prevention and Emergency Protocol: Protocol on Cooperation in Preventing Pollution from Ships and, in Cases of Emergency, Combating Pollution of the Mediterranean Sea (Prevention and Emergency Protocol), adopted in 2002, replacing the corresponding 1976 Protocol, and entered into force in 2004.
- Offshore Protocol: Protocol for the Protection of the Mediterranean Sea against Pollution Resulting from Exploration and Exploitation of the Continental Shelf, the Seabed, and its Subsoil (Offshore Protocol), adopted in 1994 and entered into force in 2011.
- Hazardous Waste Protocol: Protocol on the Prevention of Pollution of the Mediterranean Sea by Transboundary Movements of Hazardous Wastes and their Disposal (Hazardous Waste Protocol), adopted in 1996 and entered into force in 2011.
- ICZM Protocol: Protocol on Integrated Coastal Zone Management in the Mediterranean (ICZM Protocol), adopted in 2008.

On 17 December 2012, the Council approved the EU's accession to the Offshore Protocol, thereby underlining the EU's commitment to reducing the environmental impacts of offshore activities in the Mediterranean through effective regional cooperation. This decision made the Offshore Protocol binding on the European Union and its institutions and strengthened the link between regional Mediterranean obligations and the EU's offshore safety and environmental framework.

The Barcelona Convention, its amendments, and the associated Protocols were ratified by Greece through Laws 855/1978, 1634/1986, 3022/2002 and 3497/2006.

The Asopus-1 Project has been developed in line with the relevant provisions of the Barcelona Convention and its Protocols, as implemented in Greek legislation, through its ESIA, permitting and project design measures.

#### 5.2.3.9.1 The Protocol for the protection of the mediterranean sea against pollution resulting from exploration and exploitation of the continental shelf and the seabed and its subsoil (Offshore Protocol)

The *Protocol for the Protection of the Mediterranean Sea against Pollution Resulting from Exploration and Exploitation of the Continental Shelf and the Seabed and its Subsoil* (Offshore Protocol) to the Barcelona Convention, is a key regional legal instrument governing offshore oil and gas activities in the Mediterranean. Adopted in 1994 and in force since 2011, it establishes a comprehensive regulatory framework aimed at preventing, reducing, controlling, and, where possible, eliminating pollution arising from offshore exploration and exploitation activities. The Protocol requires Contracting Parties to ensure that all offshore operations are subject to prior written authorization, granted only after demonstration of the operator's technical competence, financial capacity, and compliance with stringent environmental and safety requirements, including the preparation of detailed Environmental Impact Assessments (EIAs). It incorporates fundamental environmental law principles such as the precautionary principle, the polluter-pays principle, and the application of Best Available Techniques (BAT) and Best Environmental Practices (BEP).

In relation to drilling fluids and cuttings, the Protocol sets out specific obligations for the controls and authorization of the use and discharge of drilling muds and associated cuttings, recognizing them as a significant source of marine pollution. Operators are required to minimize their environmental impact through the use of less harmful substances, appropriate discharge controls and, where required, monitoring of discharges and their composition.

The Protocol further addresses transboundary pollution, reflecting the semi-enclosed nature of the Mediterranean Sea. Contracting Parties are obligated to ensure that activities under their jurisdiction do not cause pollution damage to other States or areas beyond national jurisdiction. This includes requirements for prior assessment of potential cross-border impacts within the EIA process, information exchange, and notification procedures where there is a risk of transboundary effects.

In the context of emergency situations, the Protocol establishes obligations for preparedness and mutual assistance among Mediterranean States. Operators must develop and maintain contingency plans for incidents such as oil spills or blowouts, while States are required to cooperate and provide assistance in response to emergencies. This includes prompt notification of affected or potentially affected States, coordination of response actions, and collaboration through regional mechanisms such as the Regional Marine Pollution Emergency Response Centre for the Mediterranean Sea (REMPEC).

More broadly, the Protocol imposes strict operational controls to limit discharges of oil and hazardous substances, mandates continuous environmental monitoring and reporting, and requires the protection of sensitive ecosystems and designated marine protected areas. It also establishes liability and compensation provisions for environmental damage, as well as obligations for the safe decommissioning and removal of offshore installations. Within an EIA legislative framework, the Offshore Protocol provides the legal basis for evaluating environmental risks, addressing transboundary considerations, defining mitigation measures, and ensuring that offshore activities are conducted in accordance with internationally recognized standards for environmental protection in the Mediterranean region.

The Offshore Protocol to the Barcelona Convention was incorporated into Greek law through its ratification by the Hellenic Republic, thereby making its provisions legally binding at the national level. Greece ratified the Protocol by virtue of Law 4001/2011 (GG A' 179/22.08.2011), which primarily regulates the functioning of energy markets, including hydrocarbons exploration and exploitation, and includes provisions for the adoption of relevant international obligations. Through this law, Greece formally accepted the Offshore Protocol, aligning its domestic legal framework with the Protocol's requirements for environmental protection and safety in offshore oil and gas activities.

In addition, the implementation of the Protocol in Greece is supported by subsequent regulatory acts and environmental legislation, notably Law 1650/1986 (as amended), which establishes the general framework for environmental protection, including Environmental Impact Assessment (EIA) procedures, and Law 4409/2016, which transposes Directive 2013/30/EU on the safety of offshore oil and gas operations. Together, these instruments ensure that the obligations arising from the Offshore Protocol—such as control of discharges (including drilling fluids and cuttings), prevention of transboundary pollution, emergency preparedness and mutual assistance, and operator liability—are effectively integrated into the Greek legal and regulatory system.

As a result, within the context of an EIA in Greece, the Offshore Protocol is not applied in isolation but operates as part of a broader, harmonized legal framework combining international commitments, EU law, and national legislation, all of which must be considered when assessing offshore hydrocarbon projects.

**Table 5-8: Project Compatibility with the Offshore Protocol**

| ARTICLE        | REQUIREMENT                                                         | ASOPUS-1 COMPLIANCE ASSESSMENT                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|----------------|---------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>5</b>       | <b>Requirements for Authorizations</b>                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>5.1</b>     | Environmental assessment of proposed activities                     | <p><b>Compliant.</b> Prior to finalising the well location, environmental and geohazard surveys were undertaken to confirm the suitability of the proposed drilling site and identify any environmental, geological or anthropogenic constraints. These included an Environmental Baseline Survey (EBS), a high-resolution seabed survey and an independent shallow hazards assessment, conducted in accordance with Greek regulatory requirements, including Ministerial Decision 170225/2014 (Government Gazette B' 135/27.01.2014), and recognised Good International Industry Practice (GIIP).</p> <p>The surveys were designed to identify potential seabed features, shallow geohazards, sensitive environmental receptors and any anthropogenic objects that could affect drilling safety or require mitigation measures. The results confirmed that the proposed Asopus-1 well location is free from significant environmental or geotechnical constraints, presents a low risk of shallow drilling hazards, and is suitable for the planned exploration drilling activities.</p> |
| <b>5.2</b>     | Definition of geographical area and safety zones                    | <p><b>Compliant.</b> The drilling location and associated offshore operational area have been defined. A 500 m safety zone will be established around the MODU.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>5.3</b>     | Professional and technical qualifications                           | <p><b>Compliant.</b> Offshore personnel are required to hold relevant certifications and competency qualifications appropriate to their role. Drilling personnel are trained in accordance with recognised offshore industry requirements.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| <b>18.1</b>      | Mutual assistance in emergencies                                               | <b>Compliant.</b> Emergency response arrangements provide for coordination with national authorities and regional response mechanisms where required (Section 6.6.7).                                                                                      |
| <b>19</b>        | <b>Monitoring</b>                                                              |                                                                                                                                                                                                                                                            |
| <b>19.1</b>      | Monitoring of environmental effects                                            | <b>Compliant.</b> Environmental monitoring includes baseline surveys, drilling monitoring, emissions inventories, waste tracking, discharge controls and a post-drilling ROV seabed survey around the wellhead (Section 12.2).                             |
| <b>19.2</b>      | Regulatory monitoring systems                                                  | <b>Compliant.</b> Project monitoring will support compliance verification under HEREMA requirements and permit conditions (Section 12.2).                                                                                                                  |
| <b>20</b>        | <b>Removal of installations</b>                                                |                                                                                                                                                                                                                                                            |
| <b>20.1</b>      | Removal of installations                                                       | <b>Compliant.</b> Upon completion of drilling, the well will be plugged and abandoned. Temporary subsea equipment will be recovered and seabed clearance verified by an ROV survey (Section 6.14).                                                         |
| <b>20.2–20.3</b> | Pipelines and abandoned infrastructure                                         | <b>Not Applicable.</b> No subsea pipelines will be installed as part of the exploration drilling programme.                                                                                                                                                |
| <b>20.4–20.6</b> | Modification, transfer or enforcement actions                                  | <b>Compliant.</b> Any modifications to operational requirements would be implemented through the regulatory approval process.                                                                                                                              |
| <b>21</b>        | <b>Specially protected areas</b>                                               |                                                                                                                                                                                                                                                            |
| <b>21.1</b>      | Specially protected areas                                                      | <b>Compliant.</b> Environmental surveys and impact assessments confirm that the proposed well location is outside designated protected areas. Appropriate ecological screening of nearby protected sites and sensitive habitats has been undertaken        |
| <b>23</b>        | <b>International rules, standards and recommended practices and procedures</b> |                                                                                                                                                                                                                                                            |
| <b>23.1–23.3</b> | International rules, standards and good practice                               | <b>Compliant.</b> The Project applies, where applicable, recognised international standards including relevant API standards, ISO 16530-1, OEUK Guidelines, IFC EHS Guidelines, IOGP guidance, MARPOL requirements and BAT/BEP principles (Section 5.4.1). |
| <b>26</b>        | <b>Transboundary pollution</b>                                                 |                                                                                                                                                                                                                                                            |
| <b>26.1–26.5</b> | Transboundary pollution                                                        | <b>Compliant.</b> Potential transboundary impacts, including accidental spill scenarios, have been assessed through the ESIA and oil spill modelling. No significant transboundary impacts are anticipated under normal operations.                        |
| <b>27</b>        | <b>Liability and compensation</b>                                              |                                                                                                                                                                                                                                                            |
| <b>27.1–27.2</b> | Liability and compensation                                                     | <b>Compliant.</b> The Operator maintains financial security arrangements and remains responsible for environmental protection, remediation and compensation obligations under applicable legislation.                                                      |

The Asopus-1 exploration drilling project is considered compatible with the applicable provisions of the Barcelona Convention Offshore Protocol based on the current design and planned operations. Compliance is demonstrated through the completion of environmental baseline studies and impact assessment, implementation of BAT and GIIP, use of water-based drilling fluids, management of chemicals and wastes

through approved procedures, application of well integrity and emergency response systems, environmental monitoring, and commitment to plug and abandon the well in accordance with recognised international standards and regulatory requirements.

#### 5.2.3.9.2 Comparative analysis between the Offshore Protocol (Barcelona Convention) and EU Directive on safety of offshore oil and gas facilities (2013/30/EC)

Even during the early development phase of Directive 2013/30/EU on safety of offshore oil and gas operations, it was recognised that both this EU instrument and the Offshore Protocol to the Barcelona Convention would apply in parallel to offshore installations within the territorial waters and Exclusive Economic Zones of EU Member States. This dual regulatory framework remains in force today and requires careful coordination to ensure consistency, avoid duplication, and guarantee full compliance with both environmental and safety obligations across the lifecycle of offshore oil and gas operations.

Although both legal instruments share overarching objectives, namely the reduction of risks to the marine environment and human safety, they differ in their primary focus. The Offshore Protocol is principally oriented toward prevention of marine pollution from offshore exploration and exploitation activities, whereas Directive 2013/30/EU (now fully transposed into national law across EU Member States) establishes a comprehensive offshore safety regime focused on major accident prevention, risk management, and operator liability. In parallel, relevant provisions of broader EU environmental legislation—particularly the Environmental Impact Assessment Directive (2011/92/EU as amended by 2014/52/EU), the Industrial Emissions Directive (2010/75/EU), and the Marine Strategy Framework Directive (2008/56/EC)—also apply to offshore activities, strengthening environmental protection requirements beyond the scope originally considered in earlier comparative analyses.

Since the adoption of Directive 2013/30/EU, EU Mediterranean Member States have fully transposed its provisions into national legislation, integrating requirements such as the Major Accident Prevention Policy (MAPP), Safety and Environmental Management Systems (SEMS), independent verification schemes, and mandatory Major Hazard Reports. At the same time, Contracting Parties to the Barcelona Convention have continued to develop implementation tools for the Offshore Protocol, including regional guidelines, compliance monitoring mechanisms, and cooperation frameworks under UNEP/MAP, reinforcing the alignment between regional and EU regimes.

The parallel application of these two frameworks remains particularly relevant in the Mediterranean context, where EU Member States must ensure compliance with both systems simultaneously. In practice, the Offshore Protocol's requirements—such as environmental permitting conditions, control of discharges, protection of sensitive marine areas, and emergency preparedness—are largely reflected in EU law through Directive 2013/30/EU and associated environmental acquis. However, the Protocol retains added value in certain areas, particularly in marine environmental protection standards, transboundary cooperation, and regional emergency response coordination, which are further operationalised through mechanisms such as the Regional Marine Pollution Emergency Response Centre for the Mediterranean Sea (REMPEC).

A key development in the current regime is the increased emphasis on climate and environmental integration, driven by the EU Green Deal and the objective of climate neutrality under Regulation (EU) 2021/1119 (European Climate Law). While this does not directly amend the Offshore Protocol, it influences

national permitting and EIA practice by requiring stronger consideration of greenhouse gas emissions, cumulative impacts, and long-term environmental risk in offshore project assessments.

Today, the Offshore Protocol and EU offshore safety framework operate as complementary and mutually reinforcing systems. Directive 2013/30/EU provides a detailed, legally binding safety architecture covering the entire lifecycle of offshore operations—from design and licensing to decommissioning—while the Offshore Protocol strengthens regional environmental protection and transboundary cooperation. EU Member States, particularly in the Mediterranean, must therefore ensure integrated implementation through their national permitting systems, EIA procedures, and offshore regulatory frameworks, ensuring that both safety and environmental obligations are addressed in a coherent and non-duplicative manner.

This evolving interplay has been further analysed in subsequent European Commission work and Mediterranean regional assessments building on the earlier study “Safety of offshore exploration and exploitation activities in the Mediterranean: creating synergies between the forthcoming EU Regulation and the Protocol to the Barcelona Convention” (Milieu, 2013), while newer policy developments continue to reinforce the need for harmonised implementation and improved regional coordination.

### 5.2.3.10 International Convention for the prevention of pollution from ships (MARPOL)

The International Convention for the Prevention of Pollution from Ships (MARPOL) is the main international convention addressing the prevention of pollution of the marine environment from ships, whether caused by operational or accidental reasons.

The MARPOL Convention was adopted on November 2, 1973, under the framework of the International Maritime Organization (IMO). The 1978 Protocol was adopted in response to a surge of tanker accidents during 1976–1977. Since the 1973 MARPOL Convention had not yet entered into force, the 1978 MARPOL Protocol absorbed the parent Convention. The combined instrument came into effect on December 2, 1983. In 1997, a Protocol amending the Convention was adopted, and a new Annex VI was added, which entered into force on May 19, 2005. MARPOL has been updated periodically through amendments.

The Convention includes regulations aimed at preventing and minimizing pollution from ships, both accidental pollution and pollution from routine operations, and currently comprises six technical Annexes. Most Annexes include Special Areas with strict controls on operational discharges.

**Annex I:** Regulations for the Prevention of Pollution by Oil (entered into force on October 2, 1983)

- It covers the prevention of pollution by oil from operational measures as well as from accidental discharges. The 1992 amendments to Annex I made double hulls mandatory for new oil tankers and established a phased timetable for the retrofit of double hulls on existing tankers, which was subsequently revised in 2001 and 2003.

**Annex II:** Regulations for the Control of Pollution by Noxious Liquid Substances in Bulk (entered into force on October 2, 1983)

- It describes in detail the discharge criteria and measures for controlling pollution from noxious liquid substances carried in bulk. Approximately 250 substances have been evaluated and are included in the list attached to the Convention. The discharge of their residues is permitted only at reception facilities up to certain concentrations and under conditions (which vary depending on the category of substances)

that must be observed.

- In any case, the discharge of residues containing noxious substances is prohibited within 12 miles from the nearest shore.

**Annex III:** Prevention of Pollution by Harmful Substances Carried by Sea in Packaged Form (entered into force on July 1, 1992)

- It contains general requirements for the issuance of detailed standards on packaging, labeling, documentation, quantity limitations, exemptions, and notifications.
- For the purposes of this Annex, “harmful substances” are substances classified as marine pollutants in the International Maritime Dangerous Goods Code (IMDG Code) or that meet the criteria of the Appendix to Annex III.

**Annex IV:** Prevention of Pollution by Sewage from Ships (entered into force on September 27, 2003)

- It includes the requirements for controlling pollution of the sea by sewage. The discharge of sewage into the sea is prohibited unless the ship operates an approved sewage treatment plant or discharges comminuted and disinfected sewage using an approved system at a distance greater than three nautical miles from the nearest shore. Sewage that is neither comminuted nor disinfected must be discharged at a distance greater than 12 nautical miles from the nearest shore.

**Annex V:** Prevention of Pollution by Garbage from Ships (entered into force on December 31, 1998)

- It deals with various types of garbage and defines the distances from the shore and the way they can be disposed of. The most important feature of the Annex is the complete ban it imposes on the discharge of any form of plastic into the sea.

**Annex VI:** Prevention of Air Pollution from Ships (entered into force on May 19, 2005)

- It sets limits on sulfur oxide (SOx) and nitrogen oxide (NOx) emissions from ship exhaust gases and prohibits deliberate emissions of ozone-depleting substances. In designated emission control areas, stricter standards apply for SOx, NOx, and particulate matter. A chapter approved in 2011 covers mandatory technical and operational energy efficiency measures aimed at reducing greenhouse gas emissions from ships.

The MARPOL Convention, its amendments, and protocols were ratified by Greece through the following laws, Presidential Decrees, and Ministerial Decisions:

- Law 1269/1982 (GG 89/A/21-07-1982)
- Presidential Decree 404/1986 (GG 182/A/26-11-1986)
- Presidential Decree 254/1989 (GG 120/A/11-05-1989)
- Presidential Decree 288/1992 (GG 147/A/02-09-1992)
- Presidential Decree 103/1992 (GG 47/A/31-03-1992)
- Presidential Decree 46/1993 (GG 17/A/17-02-1993)
- Presidential Decree 361/1996 (GG 233/A/20-09-1996)
- Presidential Decree 54/1999 (GG 53/A/22-03-1999)
- Presidential Decree 128/2000 (GG 112/A/06-04-2000)

- Presidential Decree 206/2000 (GG 186/A/25-08-2000)
- Presidential Decree 312/2002 (GG 273/A/13-11-2002)
- Presidential Decree 114/2006 (GG 112/A/08-06-2006)
- Ministerial Decision 2431.02/02/05 (GG 331/B/15-03-2005)
- Presidential Decree 27/2007 (GG 19/A/30-01-2007)
- Ministerial Decision 2431.02.1/02/07 (GG 197/A/23-08-2007)
- Law 3104/2003 (GG 28/A/10-02-2003)

The drilling unit and marine support vessels engaged in the Project are required to comply with the applicable provisions of MARPOL and its implementing Greek legislation, including the requirements of Annexes I, IV, V and VI on the management of oil, sewage, garbage and air emissions. These provisions are implemented through vessel-specific procedures and the Project's Pollution Prevention Management Plan (PPMP). In the following sections of this chapter, the Project's design measures for managing operational discharges and emissions from ships, and their consistency with MARPOL requirements, are described in more detail.

#### 5.2.3.11 IMO Convention on Oil Pollution Preparedness, Response and Co-operation (OPRC)

In July 1989, a summit of leading industrialized nations in Paris called on the International Maritime Organization (IMO) to further develop measures for the prevention of pollution from ships. This request was approved by the IMO Assembly in November of the same year, and work began on drafting a convention aimed at providing a global framework for international cooperation in responding to major incidents or threats of marine pollution.

The contracting parties to the International Convention on Oil Pollution Preparedness, Response and Co-operation (OPRC) are required to establish measures for responding to pollution incidents, either at the national level or in cooperation with other countries.

Ships are required to have an emergency plan for responding to oil pollution, and operators of offshore units under the jurisdiction of the Contracting Parties are also obliged to have oil pollution emergency plans or similar arrangements. These must be coordinated with national systems to ensure a prompt and effective response to oil pollution incidents.

In addition, ships are obligated to report pollution incidents to coastal authorities, and the Convention outlines in detail the actions that must be taken in response. The Convention calls for the establishment of oil spill response equipment stockpiles, the conduct of oil spill response exercises, and the development of detailed contingency plans for dealing with pollution incidents.

The Contracting Parties to the Convention are obliged to provide assistance to others in the event of an emergency pollution situation, and any assistance provided is expected to be reimbursed.

In 2000, a Protocol related to hazardous and harmful substances (OPRC-HNS Protocol) was also adopted.

The Project has been developed in line with the obligations and principles of the OPRC Convention as implemented in Greek legislation. Operational discharges and routine shipboard emissions are managed under the Project's Pollution Prevention Management Plan (PPMP) and MARPOL-compliant vessel

procedures, while preparedness and response to accidental marine pollution are addressed through the Project Emergency Response Plan (ERP). Worst-case accidental oil spill has been analysed using oil spill modelling, and the results have been used to define response strategies, resource requirements and notification procedures that are consistent with the national and regional oil pollution preparedness and response framework.

### 5.2.3.12 United Nations Convention on the Law of the Sea (UNCLOS)

The United Nations Convention on the Law of the Sea (UNCLOS), also known as the Law of the Sea Convention or the Law of the Sea Treaty, is the international agreement that resulted from the Third United Nations Conference on the Law of the Sea (UNCLOS III), held between 1973 and 1982. The Convention defines the rights and responsibilities of nations regarding their use of the world's oceans, establishing guidelines for operations, environmental protection, and the management of marine natural resources. Concluded in 1982, the Convention replaced four treaties from 1958. UNCLOS came into force in 1994.

As of January 2015, 166 countries and the European Union have acceded to the Convention. However, it remains uncertain whether the Convention codifies customary international law.

### 5.2.3.13 Stockholm Convention on Persistent Organic Pollutants (POPs)

The Stockholm Convention on Persistent Organic Pollutants (POPs) is an international environmental treaty, signed in 2001 and entered into force in May 2004, aiming to eliminate or restrict the production and use of persistent organic pollutants.

Key elements of the Convention include the obligation of developed countries to provide new and additional financial resources and measures to eliminate the production and use of intentionally produced persistent organic pollutants, to eliminate unintentional production of pollutants where feasible, and to manage and dispose of persistent organic pollutant waste in an environmentally sound manner. Attention is given throughout the Stockholm Convention, with specific references to the preamble, the objective, and the provision concerning the identification of new persistent organic pollutants.

### 5.2.3.14 International Convention for the Safety of Life at Sea (SOLAS) regarding Noise Emissions on Ships

The main objective of the SOLAS Convention, adopted in 1974, is to establish the minimum standards for the construction, equipment, and operation of ships to ensure their safety. Flag states are responsible for ensuring that ships flying their flag comply with the Convention's requirements, which is evidenced by a series of certificates required under the Convention. The prescribed inspection procedures also allow contracting states to inspect ships of other contracting states if there are serious indications of non-compliance with the Convention's requirements—this process is known as port State control. The current SOLAS Convention includes articles defining general obligations, procedures for amending the Convention, etc., as well as an Annex divided into 14 chapters.

In 2012, IMO adopted a regulation under the SOLAS Convention requiring ship construction to aim at reducing onboard noise and protecting personnel from noise exposure, in accordance with the Code on Noise

Levels on Board Ships. The Code sets maximum noise level limits in engine rooms, control rooms, workshops, accommodations, and other ship areas. The International Labour Organization's Maritime Labour Convention (MLC 2006) also establishes requirements for preventing the risk of exposure to hazardous noise levels on ships.

The SOLAS Convention was ratified by Law 1045/1980, and a series of Presidential Decrees have been issued adopting the Convention's amendments.

The drilling unit and marine support vessels engaged in the Project are required to comply with the applicable provisions of SOLAS and the Code on Noise Levels on Board Ships, as implemented in Greek and flag-state legislation, including measures to protect crew from excessive onboard noise.

### 5.2.3.15 International convention on the establishment of an international Fund for Compensation for Oil Pollution Damage (FUND)

Although the 1969 Civil Liability Convention (CLC) was a useful mechanism to ensure compensation payments for oil pollution damage, it did not adequately address all the legal, financial, and other issues raised during the Conference that approved of the CLC. The 1969 Brussels Conference is considered a compromise proposal to create an international fund, where cargo insurance interests would be registered, with the dual purpose of, on one hand, relieving the shipowner from the burden of claims under the new convention, and on the other hand, providing additional compensation to victims of pollution damage in cases where the compensation foreseen by the 1969 Civil Liability Convention was either insufficient or unattainable.

The Conference recommended that the International Maritime Organization establish this system, and the International Convention on the Establishment of an International Fund for Compensation for Oil Pollution Damage was adopted at a conference held in Brussels in 1971. It is complementary to the Civil Liability Convention.

The purposes of the Fund Convention are:

- To provide compensation for pollution damage to the extent that the protection provided by the 1969 Civil Liability Convention is inadequate.
- To provide relief to shipowners regarding the additional financial burden imposed on them by the 1969 Civil Liability Convention. This relief is subject to conditions designed to ensure compliance with maritime safety and other conventions.
- To implement the relevant objectives set out in the Convention.

According to the first purpose, the Fund is obligated to pay compensation to States and individuals who suffer damage from pollution if these parties are unable to obtain compensation from the owner of the ship from which the oil escaped, or if the compensation owed by the shipowner is insufficient to cover the damage suffered.

Under the Fund Convention, victims of oil pollution damage may be compensated beyond the liability limit of the shipowner. However, the Fund's obligations are limited. When there is no liable shipowner or the shipowner responsible is unable to meet their liability, the Fund must pay the full amount of the compensation owed. Under certain conditions, the Fund's maximum liability can be increased.

Apart from a few cases, the Fund is obliged to pay compensation to victims of oil pollution damage who are unable to obtain sufficient or any compensation from the shipowner or their guarantor under the Civil Liability Convention.

The Fund's obligation to pay compensation is limited to pollution damage occurring within the territory, including the territorial waters, of the Contracting States. The Fund is also obliged to pay compensation related to measures taken by a Contracting State outside its territory.

The Fund may also provide assistance to Contracting States threatened or affected by pollution and wishing to take measures to combat it. This assistance may take the form of personnel, equipment, credit facilities, or other support.

Regarding its second main function, the Fund is obliged to compensate the shipowner or their insurer for part of the shipowner's liability under the Civil Liability Convention.

The Fund is not required to compensate the shipowner if the damage was caused by their own willful misconduct or if the accident was caused, due to the ship non-compliance (even partly) with international conventions. Additionally, the Convention includes provisions concerning the claims procedure, rights and obligations, as well as jurisdiction.

Contributions to the Fund must be made by all people receiving oil by sea in Contracting States.

Greece ratified the Convention, its Protocols, and amendments through Law 1638/1986, Presidential Decrees 270/1995, 270/1995, 286/2002, 291/2003, and Law 3482/2006.

The Project is consistent with the objectives of the Fund Convention, as any vessel operations associated with the Asopus-1 exploration well will be required to use appropriately insured ships and comply with applicable civil liability and oil pollution compensation regimes, ensuring that any qualifying oil pollution damage could be addressed within the framework of the 1969 Civil Liability Convention and the Fund Convention.

#### 5.2.3.16 Directive 2012/18/EU on the Control of Major-Accident Hazards Involving Dangerous Substances (Seveso III Directive)

Directive 96/82/EC (Seveso II) on the control of major-accident hazards involving dangerous substances established the earlier EU framework for identifying high-risk industrial sites, adopting appropriate measures to prevent major accidents involving dangerous substances, and limiting their consequences for humans and the environment. It has since been replaced by Directive 2012/18/EU (Seveso III), the current EU legislation on major accident hazards.

Seveso Directive is not directly applicable to offshore exploration drilling activities such as the Asopus-1 well. The Directive is designed to regulate fixed "establishments" where specified quantities of dangerous substances are present in onshore installations, such as chemical plants, refineries, and bulk storage facilities. An exploration well, by contrast, is a temporary, mobile offshore operation conducted using a drilling unit and does not constitute a Seveso establishment; hydrocarbons encountered during drilling remain in the subsurface reservoir and are not intentionally stored as part of the installation inventory. Any fuels, drilling fluids, and chemicals present on the drilling unit are managed under maritime and offshore petroleum safety regimes rather than under Seveso classification thresholds.

Consequently, the Project falls outside the direct scope of Seveso Directive; however, the general principles of major-accident hazard identification, prevention and risk management embodied in the Directive are reflected in applicable offshore safety legislation and industry standards governing well control and offshore operations. In this context, the Project has been designed and assessed in accordance with the offshore major hazard regulatory framework, supported by specific studies such as the Quantitative Risk Assessment (ORA) and the Report on Major Hazards (RoMH)<sup>18</sup>, which demonstrate the measures in place to prevent major accidents involving dangerous substances and to limit their consequences for people and the environment.

### 5.2.3.17 International convention for the control and management of ships ballast water and sediments (BWM)

Invasive aquatic species pose a significant threat to marine ecosystems worldwide, with shipping recognized as one of the primary pathways for their introduction into new environments. This issue has intensified over recent decades due to the growth of global trade and maritime traffic, particularly following the widespread adoption of steel-hulled vessels that use water, rather than solid materials, as ballast. The introduction of non-native species has caused severe ecological, economic, and social impacts in many regions. Available data indicate that the rate of biological invasions continues to rise at an alarming pace, and with seaborne trade volumes expected to increase further, the risk remains substantial.

To address this challenge, the Ballast Water Management (BWM) Convention, adopted in 2004, establishes international standards and procedures for the management and control of ships' ballast water and sediments. Its primary objective is to prevent, minimize, and ultimately eliminate the transfer of harmful aquatic organisms and pathogens between regions through ballast water operations.

Several guidelines have been developed to facilitate the implementation of the Convention.

The Convention will require all ships to implement a Ballast Water and Sediments Management Plan. All ships will have to carry a Ballast Water Record Book and will be required to carry out ballast water management procedures to a given standard. Existing ships will be required to do the same, but after a phase-in period.

The Convention comprises Articles that cover critical elements relating to the management of ballast water from ships mainly concerning:

General obligations that parties need to undertake to give full and complete effect to the provisions of the Convention and the Annex to prevent, minimize and ultimately eliminate the transfer of harmful aquatic organisms and pathogens through the control and management of ships' ballast water and sediments.

Stricter ballast water management measures that parties may adopt than those required by the Convention, provided these are consistent with international law. Such measures must not create greater environmental, health, or economic harm than the risks they are intended to prevent.

---

<sup>18</sup> Energean Hellas Ltd, RoMH Stena DrillMAX Submission - Block 2 Exploration, Document Ref. GRC-BL2-HSE-DRI-006, May 2026

Ports and terminals obligations where ballast tank cleaning or repair activities take place and the provision of adequate sediment reception facilities for the reception and safe disposal of sediments removed from ships' ballast tanks.

The encouragement of parties to undertake research and monitoring of the effectiveness of ballast water management measures applied and to promote scientific and technical research to achieve the transfer reduction of harmful aquatic organisms and pathogens.

The certification, inspection and surveillance of ships by port authorities, the regular confirmation that ships are carrying valid Ballast Water Management Certificates and the review of Ballast Water Record Books.

The encouragement of parties to provide technical assistance and cooperation, including personnel training, technology transfer, equipment availability, research initiatives, and capacity-building activities, to support the effective implementation of the Convention worldwide.

The Annex of the Convention provides the operational, technical, and certification framework for controlling ballast water and sediments, thereby reducing the risk of introducing invasive aquatic species and protecting marine ecosystems.

- Section A – General Provisions, establishes the scope, definitions, application, and exemptions of the Convention. It requires that ballast water may only be discharged in accordance with approved ballast water management procedures.
- Section B – Management and Control Requirements for Ships, requires ships to carry and implement an approved Ballast Water Management Plan and maintain a Ballast Water Record Book documenting ballast water operation. It also sets out management requirements, including ballast water exchange procedures and sediment removal and disposal practices.
- Section C – Additional Measures, allows Parties to introduce stricter national or regional measures to further prevent the transfer of harmful aquatic organisms and pathogens. Such measures must be communicated to the IMO and coordinated with potentially affected neighbouring States.
- Section D – Standards for Ballast Water Management, establishes the technical standards for ballast water management:
  - D-1 Standard: Requires ballast water exchange with at least 95% volumetric efficiency, generally conducted offshore and in deep waters.
  - D-2 Standard: Limits the concentration of viable organisms and indicator microbes discharged in ballast water, typically achieved through approved treatment systems. This section also sets approval requirements for ballast water treatment systems, allows testing of innovative treatment technologies, and requires periodic review of the standards by the IMO.
- Section E – Survey and Certification Requirements, defines survey, inspection, certification, and renewal requirements to verify compliance with the Convention. Ships must obtain and maintain a valid Ballast Water Management Certificate and keep records demonstrating compliance.

The Project has been designed to comply with the requirements of the Ballast Water Management (BWM) Convention. Compliance is consistent with the relevant provisions of Regulations B-1, D-1, D-2, and D-3, including the implementation of an approved Ballast Water Management Plan, the maintenance of a Ballast Water Record Book, adherence to ballast water exchange and performance standards, and the use of approved ballast water management systems relating to the rig and supporting vessels.

### 5.2.3.18 Industrial emissions directive (2010/75/EU)

Directive 2008/1/EC on Integrated Pollution Prevention and Control (commonly known as the "IPPC Directive") established the original EU framework for the integrated permitting of industrial installations based on Best Available Techniques (BAT). The issuance of this permit requires compliance with certain environmental requirements so that businesses themselves undertake the prevention and reduction of pollution they may cause.

Integrated prevention and control of pollution apply to industrial and agricultural activities, whether new or existing, with a high pollution potential, as defined in Annex I of the Directive (energy industries, metal production and processing, mining industry, chemical industry, waste management).

For an industrial or agricultural facility to obtain an operating permit, it must comply with certain fundamental obligations mainly concerning:

- use of all necessary pollution control measures, primarily the application of the best available techniques (to minimize waste generation, use the least hazardous substances, enable the recovery and recycling of emitted substances, etc.)
- prevention of any major pollution incidents
- prevention, recycling, or disposal of waste with the least polluting impact
- efficient use of energy
- prevention of accidents and the limitation of their consequences
- the restoration of the site after the completion of activities.

Directive 2008/1/EC was subsequently repealed and recast by Directive 2010/75/EU on Industrial Emissions (IED), which remains the principal EU legislation governing industrial emissions. The IED has since been replaced by Directive (EU) 2024/1785, which strengthens pollution prevention measures, expands the scope of regulated activities, and reinforces the EU's objectives for environmental protection and sustainable industrial operations.

The proposed project is not directly subject to the IPPC/IED Directive as it concerns an offshore exploration well without production facilities, and the associated onshore support activities do not fall within any of the categories listed in Annex I of the Industrial Emissions Directive.

### 5.2.3.19 Convention for the prevention of marine pollution by dumping of wastes and other matter (London Convention)

The Convention for the Prevention of Marine Pollution by Dumping of Wastes and Other Matter (London Convention) is one of the first global conventions for the protection of the marine environment from human activities and has been in force since 1975. Its aim is to promote effective control of all sources of marine pollution and to take all practical measures to prevent marine pollution caused by the dumping of waste and other matter. Currently, 87 countries are contracting parties to the Convention, including Greece. In 1996, the "London Protocol" was agreed upon for further modernization and eventual replacement of the Convention. According to the Protocol, all dumping practices are prohibited except for waste accepted on the so-called "reverse list," which includes the following:

- Dredged material
- Sewage sludge
- Fish waste
- Vessels and platforms
- Inert, inorganic geological materials (e.g. mining waste)
- Organic materials of natural origin
- Bulky items primarily comprising iron, steel, concrete
- Waste from carbon dioxide capture processes

The Protocol entered into force on March 24, 2006, with 51 contracting parties. Greece ratified the London Convention through Law 1147/1981 but has not yet ratified the corresponding London Protocol.

The Project is consistent with the objectives of the Convention, which aim to prevent marine pollution arising from the dumping of waste and other matter. The following sections of this chapter set out the alignment of project-specific design measures for the management of operational discharges and ship-generated waste, demonstrating that the planned activities do not entail prohibited dumping.

#### 5.2.3.20 Regulation (EC) 1907/2006 concerning the Registration, Evaluation, Authorisation and Restriction of Chemicals (REACH)

The REACH Regulation, which entered into force on June 1, 2007, requires manufacturers and importers of chemical products to assess the risks arising from the use of chemical substances and to manage those risks. REACH applies to the manufacture, placing on the market, or use of substances in their pure form, in mixtures, or in articles, as well as the placing of mixtures on the market. A “substance” is defined as a chemical element and its compounds in the natural state or as obtained by any manufacturing process.

Key elements of REACH include the registration requirements, under which the production or import of chemical substances in quantities of one ton or more per year must be registered. Substances of very high concern are also subject to an authorisation process. Additionally, the REACH Regulation implements a restriction procedure, which sets limitations on the manufacturing conditions, use(s), and/or placing on the market of a substance—or may even lead to a complete ban on its manufacture, use, or placing on the market.

Although the draft EU Regulation does not specifically refer to REACH, it is considered relevant, as the Offshore Protocol requires that the use of chemical substances for the exploration and/or exploitation of resources be regulated, restricted, or prohibited.

The Project is consistent with the objectives and relevant provisions of the said Regulation, as its design considers applicable REACH requirements for the selection, documentation and use of chemical substances and mixtures in the Chemical Use Plan and associated management measures.

The Project complies with the restrictions and guidelines of the said Regulation, as its design has incorporated all specifications related to the use of chemical substances.

### 5.2.3.21 OSPAR Convention - Offshore Chemical Notification Scheme (OCNS)

The OSPAR Commission Convention is the principal international legal framework established for the protection of the marine environment of the North-East Atlantic against pollution and other adverse effects arising from human activities. Although it does not apply directly to offshore activities in Greece, several OSPAR-developed methodologies and guidance documents are widely recognised as Good International Industry Practice (GIIP) for offshore environmental management. In particular, the Harmonised Offshore Chemical Notification Format (HOCNF) and associated chemical assessment methodologies are frequently utilised within the offshore oil and gas industry to support chemical selection, environmental risk assessment and substitution of products with lower environmental impact.

The Convention was adopted in 1992 through the unification and modernization of the earlier Oslo Convention (1972), concerning the prevention of marine pollution by dumping from ships and aircraft, and the Paris Convention (1974), concerning pollution from land-based sources. The OSPAR Convention entered into force in 1998 and establishes legally binding obligations for Contracting Parties to take all possible measures to prevent and eliminate pollution, protect maritime ecosystems and biodiversity, and ensure the sustainable use of marine resources.

The Convention addresses multiple sources of marine pollution, including land-based sources, offshore oil and gas activities, dumping and incineration at sea, and the protection of marine ecosystems and biodiversity. Of particular relevance to offshore hydrocarbon exploration and production activities is Annex III of the Convention, which concerns the prevention and elimination of pollution from offshore sources. Annex III requires Contracting Parties to implement regulatory and operational measures ensuring that offshore installations and associated activities are designed, operated, and maintained in a manner that minimizes the risk of pollution and environmental harm.

Within this framework, the OSPAR system has also developed harmonized mechanisms for the environmental management of offshore chemicals, including the Harmonised Mandatory Control System (HMCS) and the Harmonised Offshore Chemical Notification Format (HOCNF), which form the basis of national schemes such as the Offshore Chemical Notification Scheme (OCNS). Similar mechanisms for non-OSPAR regions (Mediterranean) can establish standardized procedures for the environmental assessment, classification, authorization, and substitution of offshore chemicals based on their ecotoxicological characteristics and environmental risk profile. Consequently, the OSPAR Convention constitutes the overarching international framework governing environmental protection requirements applicable to offshore hydrocarbon activities in the North-East Atlantic region, including obligations relating to pollution prevention, chemical management, environmental monitoring, and continuous improvement of environmental performance.

The Convention further promotes the application of Best Available Techniques (BAT), Best Environmental Practice (BEP), pollution prevention principles, risk-based environmental management, and the precautionary principle in offshore operations.

The Project may use OSPAR-derived methodologies as part of Good International Industry Practice when evaluating offshore chemical products and compiling the Chemical Use Plan (CUP). These tools can be used to screen, compare, and document the environmental hazards of chemicals and to support transparent product selection and substitution decisions. They are used solely as technical support and do not create additional legal obligations beyond those set by Greek legislation, the Barcelona Convention Offshore

Protocol and the REACH Regulation, which together form the binding regulatory framework for chemical management.

The Project design and operating procedures apply the principles of pollution prevention, minimisation of offshore discharges, Best Available Techniques (BAT), Best Environmental Practice (BEP) and ongoing environmental management and monitoring. Offshore chemicals will be selected for their environmental performance and suitability for offshore use, considering recognised international methodologies where appropriate. The detailed assessment of chemical suitability and the full chemical inventory are set out in the Chemical Use Plan (CUP) accompanying this Environmental and Social Impact Assessment, prepared in compliance with applicable Greek legislation, the REACH Regulation and the requirements of the Barcelona Convention Offshore Protocol.

## 5.2.4 Legislative framework for human rights and social welfare

### 5.2.4.1 Social welfare legislation in Greece

National legislation on social welfare includes:

- Articles 29 and 30 of Presidential Decree 141/2013.
- Establishment of the Asylum Service by Law 3907/2011, which began operating in June 2013. It is the first independent structure in Greece responsible for examining international protection applications. The same law established the Appeals Authority, which reviews appeals against decisions of the Asylum Service rejecting international protection applications at first instance, as well as the Reception and Identification Service, through which a system of first reception and registration of the data and needs of those entering Greece without legal formalities was launched, including individuals wishing to seek asylum. Currently, the operation of all three services is regulated by Law 4375/2016.
- Article 1 (IA) (2) of Law 4093/2012, as amended by Article 6 of Law 4472/2017.
- Article 10 of Law 3220/2004.
- JMD G4a/F.225/161 (GG 108/B/15.2.1989).
- Article 235 of Law 4389/2016.
- Article 93 of Law 4387/2016.

### 5.2.4.2 Human rights framework in Greece

The Greek authorities make every possible effort to ensure that the level of protection of fundamental rights is upheld by all state bodies and institutions, to guarantee the rules of a free, non-discriminatory democratic society. In the hierarchy of legal rules that guarantee the protection of fundamental rights, the Greek Constitution, as the supreme law, includes a special chapter on individual and social rights (Part B - Articles 4-25) (Greek Council for Refugees, 2019).

The Hellenic National Commission for Human Rights (HNCHR), as an independent advisory body of the State on matters of Human Rights protection, constitutes the National Human Rights Institution (NHRI). According to UN principles, within the scope of its powers granted by its founding law, it is tasked with monitoring

developments in its areas of activity, addressing the competent state services, and undertaking initiatives to raise public awareness (Greek Council for Refugees, 2019). The HNCHR places special importance on the status of international protection and has issued a series of related decisions (reports, statements, announcements), such as the recent reference report on refugees (September 2019), which outlines the HNCHR's positions on the reception and housing of applicants for international protection, the detention of applicants for international protection, international protection procedures at the first and second instance, unaccompanied minors, the pushback of third-country nationals at the Greek-Turkish borders, and the integration of refugees in Greece (Greek Council for Refugees, 2019).

Additionally, the National Action Plan for Human Rights was established by the Greek State for the period 2014-2016 to strengthen, implement, and protect fundamental rights in Greece.

#### 5.2.4.3 International human rights framework

International law on human rights is based on the Universal Declaration of Human Rights and consists of 9 core international instruments with additional optional protocols. The relevant international instruments on human rights are listed below:

- International Covenant on Civil and Political Rights (ICCPR): The ICCPR recognizes the dignity of every individual and promotes the protection of individuals' freedom from state interference, ensuring that everyone can participate in civil society. Freedom of speech and freedom of assembly are part of these rights.
- International Covenant on Economic, Social and Cultural Rights (ICESCR): The parties to the ICESCR agree to protect the enjoyment of these rights from violations by third parties.

#### 5.2.4.4 International labour rights regulations

The International Labour Organization (ILO) is a UN agency that sets labor standards, develops policies, and designs programs that promote decent work for all women and men.

The eight fundamental conventions of the ILO are as follows:

- Convention on Freedom of Association and Protection of the Right to Organise, 1948 (No. 87)
- Convention concerning the Application of the Principles of the Right to Organise and to Bargain Collectively, 1949 (No. 98)
- Convention concerning Forced or Compulsory Labour, 1930 (No. 29) (and the 2014 Protocol)
- Convention concerning the Abolition of Forced Labour, 1957 (No. 105)
- Convention concerning the Minimum Age, 1973 (No. 138)
- Convention concerning the Worst Forms of Child Labour, 1999 (No. 182)
- Convention concerning Equal Remuneration, 1951 (No. 100)
- Convention concerning Discrimination (Employment and Occupation), 1958 (No. 111)
- C155 - Occupational Safety and Health Convention, 1981 (No. 155)
- C187 - Promotional Framework for Occupational Safety and Health Convention, 2006 (No. 187)

Greece has ratified the following ILO conventions:

- Greece has ratified 75 Conventions and 2 Protocols, of which 52 are currently in force. Eleven Conventions have been denounced, and 12 instruments have been abrogated. Of the 75 Conventions and 2 Protocols ratified by Greece, 2 have been ratified in the past 12 months.
- Fundamental Conventions: 10 out of 10.
- Governance (Priority) Conventions: Greece has not ratified Convention C129 – Labour Inspection (Agriculture), 1969.
- Technical Conventions: 62 out of 178.

#### 5.2.4.5 Aarhus convention

The United Nations Economic Commission for Europe (UNECE) Convention on Access to Information, Public Participation in Decision-Making and Access to Justice in Environmental Matters was adopted on 25 June 1998 in the city of Aarhus, Denmark, during the Fourth Ministerial Conference in the framework of the “Environment for Europe” process.

The Convention:

- Links environmental and human rights
- Recognizes that we have an obligation towards future generations
- States that sustainable development can only be achieved with the participation of all interested parties
- Connects governmental accountability and environmental protection
- Focuses on the interactions between citizens and public authorities within a democratic framework.

The subject matter of the Convention concerns the core of the relationship between citizens and governments and addresses governmental accountability, transparency, and responsiveness.

The Aarhus Convention grants rights to citizens and imposes obligations on the Parties and public authorities regarding access to information, public participation, and access to justice.

The Aarhus Convention also establishes a new process for public participation in the negotiation and implementation of international agreements.

Its three main pillars are as follows:

- **Access to information:** Every citizen must have the right to broad and easy access to environmental information. Public authorities are obliged to provide all the required information, and to collect and disseminate it in a timely and transparent manner. This includes information about the state of the environment, the policies and measures being taken, or the state of human health and safety in cases where it may be affected by the condition of the environment. Certain information is exempt from disclosure, such as in cases where disclosure would negatively affect international relations, national defense, public security, the functioning of justice, trade secrets, or the confidentiality of personal data. Information may also be withheld if its release could harm the environment, such as the locations of breeding grounds of rare species.
- **Public participation in decision-making:** Citizens have the right to participate in decision-making on

environmental matters. Public authorities must ensure that mechanisms are in place to allow the public to be informed and, if they wish, to comment on proposals for projects that affect the environment, or on plans and programs relating to the environment. Any comments must be considered in the decision-making process. Decision-makers can benefit from the knowledge and experience of citizens. This contribution is a significant opportunity to improve the quality of environmental decisions and outcomes, and it guarantees procedural legitimacy.

- **Access to justice:** Citizens have the right to judicial or administrative appeal procedures in cases where a Party violates or fails to comply with the principles of the Convention. In other words, they have the right to seek redress when environmental law is violated and to access review procedures to challenge public decisions made without consideration of the Convention's other two pillars.

The project's design, development, and permitting processes are intended to comply with the requirements of the Aarhus Convention.

#### 5.2.4.5.1 European legislation

The EU legislation concerning public consultation, public participation, and stakeholder involvement in environmental information includes the following Directives:

- Directive 2003/35/EC of the European Parliament and of the Council, dated 26 May 2003, on public participation in the preparation of certain plans and programs relating to the environment, and amending, with regard to public participation and access to justice, Council Directives 85/337/EEC and 96/61/EC. Directive 2003/35/EC refers to the second pillar of the "Aarhus Convention."
- Directive 2003/4/EC of the European Parliament and of the Council, dated 28 January 2003, on public access to environmental information and repealing Council Directive 90/313/EEC. Directive 2003/4/EC refers to the first pillar of the "Aarhus Convention."

#### 5.2.4.5.2 National legislation

Greece has ratified and incorporated the European legislation concerning the requirements for consultation and public and stakeholder participation in environmental information through the following laws:

- JMD 1649/45/2014, as amended by JMD 5688/2018, includes provisions and specifications regarding: a) the means of consultation between various authorities, and b) the ways of informing the public as well as their participation in public consultation during the environmental permitting process.
- JMD 21398/2012 concerns the creation and operation of a dedicated website for publishing decisions related to the approval, renewal, or modification of environmental permits.
- JMD 9269/470/2007 relates to judicial procedures for protecting the public from administrative acts or omissions regarding the disclosure of information and participation during the environmental permitting process.
- JMD 11764/653/2006 incorporates Directive 2003/4/EC regarding public access to environmental information.
- Law 3422/2005 ratifies the Aarhus Convention (Directive 2003/35/EC).

- JMD 3711/2021/2003 concerns media tools and citizen participation during the approval of environmental terms.

### 5.3 International – EU – National environmental protection goals related to the project

#### 5.3.1 International – EU environmental protection goals related to the project

##### 5.3.1.1 United Nations 2030 Agenda

---

The 2030 Agenda for Sustainable Development, along with the 17 Sustainable Development Goals and 169 targets, was adopted within the framework of the United Nations General Assembly on September 25, 2015, through the resolution "Transforming Our World: The 2030 Agenda for Sustainable Development."

The 2030 Agenda is the most ambitious global agreement ever achieved by the UN, as it is an action plan for People, Planet, and Prosperity. The 2030 Agenda promotes the integration of all three dimensions of sustainable development — social, environmental, and economic — across all sectoral policies, while also fostering the interconnection and coherence of policies and legislative frameworks related to the **Sustainable Development Goals (SDGs)**.

Sustainable development can be understood through addressing challenges related to the following five pillars (5 P):

- People,
- Planet,
- Prosperity,
- Peace,
- Partnership.

The 17 SDGs (as shown in the following diagram) were adopted by the 193 UN member states, including Greece, and are universal with a target implementation timeline until 2030.

They serve as a roadmap for achieving a better and more sustainable future for all. The goals are interconnected and indivisible, meaning that achieving one goal impacts the achievement of others.

# 2030 Agenda

UN Sustainable Development Goals

Source: United Nations Regional Information Centre, <https://unric.org/>

Figure 5-5: Sustainable Development Goals of the United Nations 2030 Agenda

The 2030 Agenda is the international community's roadmap for achieving sustainable development for all — that is, economic development that guarantees social well-being without exclusion and the protection of the environment and natural resources for the benefit not only of current but also future generations — by 2030.

For the implementation of the SDGs, all UN member states have made commitments, and the EU, together with its member states, has committed to taking a leading role in the implementation of the United Nations 2030 Agenda.

In November 2016, the European Commission presented its strategic approach for implementing the Sustainable Development Goals of the 2030 Agenda.

Key actions for the implementation of the 2030 Agenda include the following:

- Integration of the SDGs into all EU policies and initiatives, so that sustainable development becomes a fundamental guiding principle in all European Commission policies.
- Regular reporting on the EU's progress, starting in 2017.

- Promotion of the implementation of the 2030 Agenda jointly with the governments of EU member states, the European Parliament, other European institutions, international organizations, civil society organizations, citizens, and other stakeholders.
- Creation of a high-level platform involving multiple stakeholders to promote the exchange of best practices across all sectors at both national and European levels.
- Formulation of a long-term vision extending beyond 2020.

The SDGs are interconnected and therefore require a much more integrated approach across all policy sectors – from addressing poverty and social exclusion (SDG 1), ensuring universal access to quality health (SDG 3) and education services (SDG 4), securing full employment and decent work for all (SDG 8), promoting development in the fields of industry, innovation, and infrastructure (SDG 9), and reducing social and regional inequalities (SDG 10), to ensuring integrated water resource management (SDG 6), promoting renewable energy and energy efficiency (SDG 7), and protecting and sustainably managing the oceans (SDG 14). Finally, the SDGs also include cross-cutting goals, such as building efficient, reliable, and transparent institutions (SDG 16) and strengthening and promoting open, participatory, and democratic processes as means of implementation (SDG 17). It is worth noting that approximately 7 out of the total 17 Goals are directly related to environmental issues (see SDG 6 – water, SDG 7 – sustainable energy, SDG 11 – sustainable cities, SDG 12 – sustainable production and consumption patterns, SDG 13 – climate change, SDG 14 – marine environment, SDG 15 – biodiversity), with environmental SDGs acting as a "catalyst" for achieving all other goals.

Potential contributions of an offshore exploration well could involve the below per possible SDG identified:

**Table 5-9: Potential contributions of an offshore exploration well**

| SDG                                                    | POTENTIAL CONTRIBUTION OF AN OFFSHORE EXPLORATION WELL                                                                                                                                                                                                                                                     |
|--------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>SDG7 – Affordable and Clean Energy</b>              | Exploration helps identify domestic hydrocarbon resources that can contribute to national energy security, diversify energy supply, and reduce reliance on imported fuels during the energy transition. It does not directly contribute to “clean energy” but may support a secure and orderly transition. |
| <b>SDG 8 – Decent Work and Economic Growth</b>         | Generates direct and indirect employment, supports local suppliers and service providers, attracts investment, and contributes to government revenues through taxes, fees, and potential future royalties if commercial resources are discovered.                                                          |
| <b>SDG 9 – Industry, Innovation and Infrastructure</b> | Promotes investment in offshore infrastructure, advanced drilling technologies, digital monitoring systems, and technical expertise, strengthening industrial capacity and innovation.                                                                                                                     |
| <b>SDG12 – Responsible Production and Consumption</b>  | Encourages efficient use of resources through environmental management systems, waste minimization, chemical management, pollution prevention, and the application of Best Available Techniques (BAT) and industry best practices.                                                                         |
| <b>SDG13 – Climate Action</b>                          | The Project incorporates measures to minimise greenhouse gas emissions, improve energy efficiency and monitor emissions in accordance with regulatory requirements and good international industry practice.                                                                                               |
| <b>SDG14 – Life Below Water</b>                        | Requires the implementation of measures to avoid or minimize impacts on the marine environment, including spill prevention and response planning, discharge controls, marine environmental monitoring, and protection of sensitive habitats and species.                                                   |

| SDG                                       | POTENTIAL CONTRIBUTION OF AN OFFSHORE EXPLORATION WELL                                                                                                                                                                                 |
|-------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>SDG17 – Partnerships for the Goals</b> | Involves collaboration between government authorities, regulators, contractors, research institutions, emergency response organizations, and local stakeholders to ensure safe and environmentally responsible project implementation. |

The Project concerns offshore hydrocarbon exploration. Should commercially viable resources be identified and subsequently developed, the Project could enhance national and regional energy security, promote a more diversified energy portfolio, and support economic activity, employment, and technological advancement, in alignment with the objectives of Sustainable Development Goals (SDGs) 7 (Affordable and Clean Energy), SDG 8 (Decent Work and Economic Growth), and SDG 9 (Industry, Innovation, and Infrastructure). During the exploration phase, the Project will adopt environmental and operational management measures consonant with SDGs 12 (Responsible Consumption and Production) and 14 (Life Below Water), including efficient resource utilisation, pollution prevention, and marine environment protection. Although exploration activities do not directly advance climate change mitigation goals, the Project acknowledges the significance of SDG 13 (Climate Action) and integrates measures to reduce greenhouse gas emissions and other environmental impacts, in accordance with applicable regulatory standards and best international industry practices.

### 5.3.1.2 8th Environment Action Programme (EAP)

Environmental action programs have guided the shaping of EU environmental policy since the early 1970s.

In March 2021, the ambassadors of the EU Member States approved a mandate for the Council to negotiate with the European Parliament to reach an agreement on the 8<sup>th</sup> Environment Action Programme (8<sup>th</sup> EAP). The 8<sup>th</sup> EAP will serve as a guide for the development and implementation of environmental and climate policy until 2030.

The Commission's proposal for the 8<sup>th</sup> Environment Action Programme (8<sup>th</sup> EAP) exceptionally does not include a list of actions but is based on the European Green Deal and the list of actions it contains.

The 8<sup>th</sup> EAP aims to accelerate the green transition in a fair and inclusive manner, with the long-term goal for 2050 of "Well-being within the limits of our planet," as established by the 7<sup>th</sup> EAP.

The six thematic priority objectives of the 8<sup>th</sup> EAP concern:

- the reduction of greenhouse gas emissions.
- adaptation to climate change.
- a development model that gives back to the planet more than it takes.
- the ambition of zero pollution
- the protection and restoration of biodiversity.
- the reduction of key environmental and climate pressures related to production and consumption.

The proposed Project is considered consistent with applicable Best Available Techniques (BAT) and Good Operating Practice (GOP) guidelines, promoting environmental protection practices, applicable to offshore hydrocarbon activities. Furthermore, measures to prevent, minimize, and manage potential environmental impacts have been incorporated into the project design, including waste management procedures and

measures to avoid, address, and remediate accidental pollution incidents, as described in Chapter 11 of this document.

### 5.3.1.3 European Green Deal

Climate change and environmental degradation threaten the very existence of Europe and the world. To address these challenges, the European Green Deal aims to transform the EU into a modern, resource-efficient, and competitive economy, ensuring the following:

- Net zero greenhouse gas emissions by 2050.
- Economic growth decoupled from resource use.
- No person and no region left behind.

One third of the €1.8 trillion investments from the Next Generation EU recovery plan, as well as the EU's seven-year budget, will finance the European Green Deal.

The European Green Deal provides an action plan to enhance resource efficiency by transitioning to a clean, circular economy, restoring biodiversity, and reducing pollution.

The plan outlines the necessary investments and available financing instruments. It explains how a fair and inclusive transition can be ensured.

The EU has set an emblematic goal to become the first climate-neutral continent by 2050. Achieving this goal requires action across all sectors of the economy, such as:

- Investments in environmental technologies.
- Support for innovation in the industrial sector.
- Development of cleaner, more economical, and healthier forms of private and public transportation.
- Decarbonization of the energy sector.
- Ensuring the energy efficiency of buildings.
- Collaboration with international partners to improve global environmental standards.

The following Figure depicts the various elements of the Green Deal as presented in the European Commission Communication, COM (2019) 640.

(Source: European Commission, <https://commission.europa.eu/>)

Figure 5-6: Elements of the European Green Deal

The proposed exploration well does not directly advance the decarbonisation objectives of the European Green Deal. However, the Project has been designed and will be implemented in accordance with applicable EU environmental legislation, incorporating measures to minimise greenhouse gas emissions, prevent pollution, protect the marine environment, and apply recognised best environmental practices. Should commercially viable resources be identified and any subsequent development pursued, such development would be subject to the climate and energy policy framework applicable at that time and may contribute to energy security during the transition to a climate-neutral economy. The Project design also incorporates measures to avoid, minimise, and manage potential environmental impacts, including waste management measures and arrangements for the prevention, response, and, where necessary, remediation of accidental pollution incidents, as described in Chapter 11.

#### 5.3.1.4 Framework for Climate and Energy for 2030

The framework for climate and energy for 2030 includes targets and policy goals at the EU level for the period from 2021 to 2030.

Within the framework of the European Green Deal, the European Commission proposed in September 2020 to increase the greenhouse gas emissions reduction target for 2030 to at least 55% compared to 1990. It examined the actions required across all sectors, including increasing energy efficiency and renewable energy sources, and initiated the process of submitting detailed legislative proposals to implement and achieve this target. This will enable the EU to move towards a climate-neutral economy and fulfill its commitments under the Paris Agreement by updating the Member States' targets.

The Commission proposes that the climate and energy framework for 2030 should be based on the full implementation of the 2020 targets and the following:

- A 40% reduction in greenhouse gas emissions by 2030 compared to 1990 levels, to be achieved through domestic measures only. These measures include a combination of a 43% emissions reduction compared to 2005 under the Emissions Trading System (ETS) as well as national actions by Member States to reduce emissions by 2030 in sectors outside the ETS.
- An increase in the share of energy from renewable sources consumed in the EU to at least 27%, which is binding at the EU level but not at the national level, allowing Member States flexibility to meet their targets in the most cost-effective way.
- Revision of the Emissions Trading System (ETS) through the creation of a new Market Stability Reserve, as well as the limitation of the annual emissions cap after 2020. Alongside this announcement, a legislative proposal was published aiming to establish the reserve.
- Further improvement of energy efficiency, which is essential for competitiveness, energy supply security, and sustainability. A revision of the 2012 Energy Efficiency Directive — later in 2014 — will help define future energy-saving policies.
- New European governance system for achieving climate and energy targets. Member States must develop national plans for competitive, secure, and sustainable energy. These plans will be reviewed and assessed by the Commission.
- Key indicators will be used to monitor progress across all aspects of competitiveness, security, and sustainable energy.

The 40% greenhouse gas reduction target is implemented through the EU Emissions Trading System, the Effort Sharing Regulation, targets for Member States' emission reductions, and regulations on land use, land-use change, and forestry. These climate-related legislative measures must be updated to implement the proposed greenhouse gas reduction target of at least 55%. This process is ongoing, and the targets have not yet been officially revised.

The proposed exploration well is not directly supporting the decarbonization objectives of the Framework for Climate & Energy for 2030. However, the project may contribute to energy security during the transition to a climate-neutral economy, while remaining subject to the EU's environmental and climate policy framework. Additionally, it should be emphasized that the project design will incorporate measures to reduce potential environmental impacts, such as waste management measures and prevention/response/restoration of accidental pollution incidents, as described in Chapter 11 of this document.

### 5.3.1.5 30<sup>th</sup> United Nations Climate Change Conference (COP28)

Every year, the COP meets to set ambitions and responsibilities for climate action, as well as to identify and evaluate climate measures. The 2025 conference was hosted by Brazil, which held the presidency of COP230. The 30<sup>th</sup> United Nations Climate Change Conference (COP30) took place between November 10 – November 21 in Belém, Brazil.

The main topics of COP30 were as follows:

- reducing greenhouse gas emissions.

- adaptation to climate change
- climate finance for developing countries
- renewable energy technologies and low-carbon solutions.
- preserving forests and biodiversity
- climate justice and the social impacts of climate change.

### 5.3.1.6 “Fit for 55” adaptation to the 55% target

---

European climate legislation makes it a legal obligation to achieve the EU’s climate target of reducing greenhouse gas emissions by at least 55% by 2030. EU countries are developing new legislation to meet this target and to make the EU climate neutral by 2050.

The “Fit for 55” package is a set of proposals for the revision and update of EU legislation and the establishment of new initiatives, aiming to ensure that EU policies are aligned with the climate targets agreed upon by the Council and the European Parliament.

The package of proposals aims to create a coherent and balanced framework for achieving the EU’s climate targets, which:

- Ensures a fair and socially equitable transition.
- Maintains and strengthens innovation and competitiveness of the EU industry, while ensuring a level playing field with economic operators from third countries.
- Establishes the EU’s position as a global leader in combating climate change.

## 5.3.2 International conventions – EU environmental protection directives

### 5.3.2.1 Habitats Directive (92/43/EEC)

---

The Habitats Directive (officially known as Council Directive 92/43/EEC on the conservation of natural habitats and of wild fauna and flora) was adopted in 1992 in response to the Bern Convention. The Directive aims to protect approximately 230 habitat types and 1,000 species listed in its Annexes, which are of European interest based on the Directive’s criteria, as follows:

- **Annex I** includes the protected habitat types.
- **Annex II** includes approximately 900 species whose habitats have been designated as Special Areas of Conservation (SACs) and are part of the Natura 2000 network. These areas must be managed according to the ecological requirements of the species.
- **Annex IV** includes more than 400 species that must be subject to strict protection across their natural range within the EU, both inside and outside the Natura 2000 network sites.
- **Annex V** includes more than 90 species for which Member States must ensure that their exploitation and removal from the wild do not adversely affect their favourable conservation status.

Directive 92/43/EEC forms the basis of European nature conservation policy, together with the Wild Birds Directive. It established the extensive European ecological network of protected areas known as Natura

2000 (Special Areas of Conservation – SACs, and Special Protection Areas – SPAs). Certain articles of the Habitats Directive (Articles 6, 12, 16, and 17) require Member States to submit reports on the status and conservation status of habitats and species, the compensatory measures taken for projects that have negative impacts on Natura 2000 sites, or any derogations from the strict protection measures of these areas.

The Habitats Directive was transposed into national legislation through JMD 33318/3028/1998, establishing measures and procedures for the conservation of natural habitats and wild fauna and flora, as amended by JMD 14849/853/E103/4-4-2008. Additionally, Law 3937/2011 on Biodiversity Conservation established the National System of Protected Areas (including Natura 2000 sites), as amended by JMD 50743/2017 (which revised the national list of Natura 2000 sites), along with general guidelines and regulations for their conservation.

As shown in Figure 5-17, no part of the project falls within any Special Areas of Conservation (SACs) within the Natura 2000 network.

The project is consistent with the objectives and relevant requirements of the current Directive, as, based on the current design and planned operations, neither onshore nor offshore activities are anticipated to induce significant adverse impacts on the Conservation Features and associated Conservation Objectives of any surrounding Natura 2000 Special Areas of Conservation (SACs).

### 5.3.2.2 Directive on the Conservation of Wild Birds (2009/409/EC)

The Birds Directive, officially known as Directive 2009/147/EC on the Conservation of Wild Birds, was adopted in 2009 and replaced Directive 79/409/EEC of April 2, 1979, on the conservation of wild birds, which had been amended several times and had become unclear. The Directive aims to protect approximately 500 bird species found in the EU and their critical habitats by designating Special Protection Areas (SPAs) within the Natura 2000 network, regulating activities that directly threaten bird populations, and promoting scientific research.

- **Annex I:** Contains 194 species and subspecies that are particularly threatened, for which Member States must designate Special Protection Areas (SPAs) to ensure their survival. All species listed are migratory.
- **Annex II:** Lists 82 bird species that may be hunted. However, hunting periods are restricted, and hunting is prohibited when the birds are most vulnerable — during their return to breeding areas, breeding, and chick development.
- **Annex III:** Includes activities that directly threaten bird populations and are completely prohibited, such as intentional killing, capture, trade, or destruction of nests. Under specific restrictions, Member States may permit certain activities for the 26 species listed in this annex.
- **Annex IV:** The Directive provides for sustainable hunting management, but Member States must eliminate all forms of non-selective and mass killing of birds, especially the methods listed in this annex.
- **Annex V:** The Directive promotes research to support the protection, management, and exploitation of all bird species covered by the Directive and listed in this annex.

The Birds Directive was transposed into national legislation through Ministerial Decision 414985/1985 on the management measures for wild bird populations, JMD 37338/1807/E.103/2010 establishing

measures and procedures for the conservation of wild birds and their habitats in compliance with Directive 79/409/EEC (as codified by Directive 2009/147/EC), and JMD 8353/276/E103/2012 amending Decision 37338/1807/2010. Furthermore, Law 3937/2011 on biodiversity conservation established the National System of Protected Areas (including Natura 2000 sites), as amended by JMD 50743/2017 (which revised the national list of Natura 2000 sites), along with general guidelines and regulations for their conservation

The Birds Directive was incorporated into national legislation through Ministerial Decision 414985/1985 on the management measures of wild bird species, JMD 37338/1807/E.103/2010 establishing measures and procedures for the conservation of wild bird species and their habitats in compliance with Directive 79/409/EEC, as codified by Directive 2009/147/EC, and JMD 8353/276/E103/2012 amending JMD 37338/1807/2010. Furthermore, Law 3937/2011 on biodiversity conservation established the National System of Protected Areas (including Natura 2000 sites), as amended by JMD 50743/2017 (revision of the national Natura 2000 sites list), along with general guidelines and regulations for their conservation.

As shown in Figure 5-17, no part of the project falls within any Special Protection Areas (SPAs) within the Natura 2000 network.

The Project is considered consistent with the guidelines and objectives of the present Directive as neither onshore nor offshore activities cause significant adverse impacts on the Protected Features nor on the corresponding Conservation Objectives of any relevant SPA areas and do not cause significant adverse effects on the Conservation Features and corresponding Conservation Objectives of any identified SACs.

### 5.3.2.3 Convention on Migratory Species (CMS or Bonn Convention)

The Convention on the Conservation of Migratory Species of Wild Animals—commonly known simply as the Convention on Migratory Species (CMS) or the Bonn Convention—aims to conserve terrestrial, marine, and avian migratory species throughout their migratory range. It is an intergovernmental treaty concluded under the auspices of the United Nations Environment Programme (UNEP) and concerns the conservation of wildlife and habitats on a global scale. The Convention was signed in 1979 in Bonn and entered into force in 1983. The Convention on Migratory Species is the only global intergovernmental organization, established under the United Nations, dedicated exclusively to the conservation and management of terrestrial, aquatic, and avian migratory species throughout their migratory range. The Convention on Migratory Species and its related agreements set policies and provide further guidance on specific issues through Strategic Plans, Action Plans, resolutions, decisions, and guidelines. All Parties maintain on their websites a list of all adopted decisions, guideline issues, and Action Plans approved by the Member States.

The Convention on Migratory Species and its subsidiary agreements (see the table below) establish policy and provide additional guidance on specific issues through Strategic Plans, Action Plans, resolutions, decisions, and guidelines. The subsidiary agreements of the Convention maintain on their respective websites lists of all decisions taken, guidelines, and Action Plans approved by the Member States. Greece ratified the Convention on Migratory Species in 1999 through Law 2719/1999. It should be noted that among the subsidiary agreements of the Convention on Migratory Species, Greece is a Member State of the ACCOBAMS Agreement, which is the main tool for the conservation of cetaceans in the Mediterranean. Additionally, Greece has signed but not yet ratified the AEWA Agreement on the Conservation of Migratory Waterbirds.

**Table 5-10: Subsidiary agreements arising from the Bonn Convention**

| ABBREVIATION             | AGREEMENT                                                                                                                                                                                                  |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ACAP</b>              | Agreement on the Conservation of Albatrosses and Petrels ( <a href="http://acap.aq/">http://acap.aq/</a> )                                                                                                 |
| <b>ACCOBAMS</b>          | Agreement on the Conservation of Cetaceans of the Black Sea, Mediterranean Sea and Contiguous Atlantic Area ( <a href="http://accobams.org/">http://accobams.org/</a> )                                    |
| <b>AEWA</b>              | Agreement on the Conservation of African-Eurasian Migratory Waterbirds ( <a href="http://www.unep-aewa.org">http://www.unep-aewa.org</a> )                                                                 |
| <b>ASCOBANS</b>          | Agreement on the Conservation of Small Cetaceans of the Baltic, North-East Atlantic, Irish and North Seas ( <a href="http://www.ascobans.org">http://www.ascobans.org</a> )                                |
| <b>EUROBATS</b>          | Agreement on the Conservation of Populations of European Bats ( <a href="http://www.eurobats.org">http://www.eurobats.org</a> )                                                                            |
| <b>Gorilla Agreement</b> | Agreement on the Conservation of Gorillas and their Habitats ( <a href="http://www.cms.int/gorilla">http://www.cms.int/gorilla</a> )                                                                       |
| <b>Wadden Sea Seals</b>  | Agreement on the Conservation of Seals in the Wadden Sea ( <a href="http://www.waddensea-secretariat.org/management/seal-management">http://www.waddensea-secretariat.org/management/seal-management</a> ) |

The Project is compatible with and does not contradict the guidelines and objectives of the CMS Convention.

#### 5.3.2.4 Agreement on the Conservation of Cetaceans in the Black Sea, Mediterranean Sea, and Contiguous Atlantic Area (ACCOBAMS)

The Agreement on the Conservation of Cetaceans in the Black Sea, the Mediterranean, and the Contiguous Atlantic Area (ACCOBAMS) is a cooperation tool for the conservation of marine biodiversity in the Mediterranean and Black Seas. The purpose of the Agreement is to reduce threats to cetaceans in the waters of the Mediterranean and Black Seas, as well as to improve the existing knowledge. According to the ACCOBAMS Conservation Plan (Annex 2 of the Agreement), the contracting Parties are called upon to designate and manage areas that serve as habitats for cetaceans as specially protected areas.

ACCOBAMS emerged from consultations among the following four conventions:

- The Convention for the Protection of the Marine Environment and the Coastal Region of the Mediterranean and its Protocol concerning Specially Protected Areas and Biological Diversity in the Mediterranean,
- The Bonn Convention for the Conservation of Migratory Species of Wild Animals,
- The Bern Convention for the Conservation of European Wildlife and Natural Habitats.

Due to the migratory nature of these species, the agreement was established under the auspices of the Bonn Convention (UNEP/CMS).

The Agreement area consists of all marine waters of the Black Sea, the Mediterranean Sea, and the adjoining area of the Atlantic Ocean west of the Strait of Gibraltar. The area includes the Pelagos Sanctuary, which is dedicated to marine mammals in the northwestern Mediterranean and was established by France, Italy, and Monaco. ACCOBAMS is the first agreement to bind the countries of these regions to cooperate in the conservation of cetaceans. An innovative aspect of this agreement is the inclusion of non-coastal countries whose maritime activities may endanger the conservation of cetaceans.

In 2010, the Parties to ACCOBAMS adopted a resolution to extend the geographic scope of the Agreement area to include the Exclusive Economic Zones of Spain and Portugal. As of 2022, the Agreement has 24

Parties: Albania, Algeria, Bulgaria, Croatia, Cyprus, Egypt, France, Georgia, Greece, Italy, Lebanon, Libya, Malta, Monaco, Montenegro, Morocco, Portugal, Romania, Slovenia, Spain, Syria, Tunisia, Turkey, and Ukraine.

In 2023, pursuant to GG 9/A/17.01.2023, Greece ratified the Agreement on the Conservation of Cetaceans of the Black Sea, Mediterranean Sea and Contiguous Atlantic Area, along with the related Final Act of the Agreement, signed in Monaco on 24 November 1996, as well as the amendments adopted by the Meeting of the Parties to the Agreement on 12 November 2010 in Monaco through Resolution A/4.1.

According to Article 4 of Annex II of the present GG, the Contracting Parties undertake coordinated, joint research on cetaceans and facilitate the development of new techniques to enhance their conservation. In particular, the Contracting Parties:

- monitor the status and trends of the species covered by this Agreement, particularly those in poorly known areas or species for which data is limited, in order to facilitate the development of conservation measures,
- cooperate to identify migratory routes as well as breeding and feeding areas of the species covered by the Agreement, in order to determine areas where human activities may need to be regulated as a result,
- assess the dietary needs of the species covered by the Agreement and accordingly adjust fishing regulations and techniques,
- develop systematic research programs for dead, stranded, injured, or sick animals, in order to determine the main interactions with human activities and to identify existing and potential threats and
- facilitate the development of passive acoustic techniques for monitoring cetacean populations.

According to the ACCOBAMS Methodological Guide on "Underwater Noise Mitigation Measures" published in 2022 (ACCOBAMS-MOP8/2022/Inf44), recommended measures are defined for mitigating the impacts of underwater noise from human activities.

According to this Guide, as well as the EU Marine Strategy Framework Directive, underwater noise generated by human activities is categorized as impulsive noise (e.g., noise from drilling operations) and continuous noise (e.g., from vessel movement). The Guide describes practices and technologies that should be used during, instead of, or in addition to conventional techniques that produce underwater noise, with the aim of reducing the acoustic impacts of human activities at sea.

The Project is compatible with and does not contradict the guidelines and objectives of this Convention, since neither the onshore nor the offshore parts of the Project, as shown in the Figure below, fall within any ACCOBAMS cetacean critical habitats or pelagos sanctuaries for marine mammals.

Figure 5-7: Critical habitats for cetaceans in the wider study area (Source: LDK).

### 5.3.2.5 Agreement on the conservation of African – Eurasian Migratory Waterbirds (AEWA Convention)

The Agreement on the Conservation of African-Eurasian Migratory Waterbirds (AEWA) is an intergovernmental treaty dedicated to the conservation of migratory waterbirds and their habitats across Africa, Europe, the Middle East, Central Asia, Greenland and the Canadian Archipelago. Developed under the framework of the Bonn Convention (CMS) and administered by the United Nations Environment Programme (UNEP), AEWA brings together countries and the wider international conservation community in an effort to establish coordinated conservation and management of migratory waterbirds throughout their entire migratory range.

The Map of the Agreement Area as presented in below is included in the text of the Agreement on the Conservation of African – Eurasian Migratory Waterbirds as amended at the 9<sup>th</sup> Session of the Meeting of the Parties to AEWA 11-14 November 2025 in Bonn, Germany (MOP9)<sup>19</sup>.

**Annex 1 a**  
**Map of the Agreement Area**

**Figure 5-8: Map of the Agreement Area (Source: Agreement on the Conservation of African - Eurasian Migratory Waterbirds - Agreement Text and Annexes as amended by MOP9)**

### 5.3.2.6 Bern Convention

The Bern Convention for the Conservation of Wildlife and Natural Habitats of Europe, also known simply as the Bern Convention, is an international legal instrument in the field of Nature Conservation, aimed at protecting the natural heritage of Europe and certain countries in Africa. The Convention was signed on September 19, 1979, and came into force on June 1, 1982. It specifically concerns the protection of natural habitats and endangered species, including migratory species.

The convention primarily aims at the following:

<sup>19</sup> [Agreement on the Conservation of African - Eurasian Migratory Waterbirds - Agreement Text and Annexes as amended by MOP9](#)

- The conservation of wild flora and fauna and their natural habitats,
- The promotion of cooperation between states,
- Focusing attention on endangered and vulnerable species, including threatened and vulnerable migratory species.

The Convention also considers the impacts that other policies may have on natural heritage and recognizes the intrinsic value of wild flora and fauna, which must be preserved and passed on to future generations. Fifty countries and the EU have already signed the Convention and are committed to promoting national conservation policies, assessing the environmental impacts of planning and development, promoting education and awareness for conservation, and coordinating related research activities. Greece signed the Convention in 1979 and ratified it with Law 1335/1983.

The Project is compatible with and does not conflict with the guidelines and objectives of the Bern Convention.

### 5.3.2.7 Convention on Biological Diversity (CBD)

The Convention on Biological Diversity (CBD), informally known as the Biodiversity Convention, is a multilateral treaty. The Convention has three main objectives:

- Conservation of biodiversity,
- Sustainable use of its components, and
- Fair and equitable sharing of the benefits arising from genetic resources.

The goal of the Convention is the development of national strategies for the conservation and sustainable use of biological diversity. The Convention is often considered the key document for sustainable development. It was signed at the Earth Summit in Rio de Janeiro in June 1992 and entered into force on December 29, 1993. For the first time in international law, the Convention recognized that the conservation of biodiversity is “a common concern of humanity” as well as an integral part of development. The Convention covers all ecosystems, species, and genetic resources. It links conservation efforts with the economic goal of using biological resources in a sustainable way. It establishes principles for the fair and equitable sharing of benefits arising from the use of genetic resources, especially those intended for commercial use. It should be noted that the Convention is legally binding, and the countries that ratify it (“Contracting Parties”) are obligated to implement its provisions.

Greece signed the Convention in June 1992 and ratified it with Law 2204/1994. According to the requirements of the CBD, Greece approved its first National Biodiversity Strategy in 2014 (Ministerial Decision 40332/2014) aiming to halt biodiversity loss and the degradation of ecosystem services by 2026. The strategy’s implementation period is 15 years (2014–2029) and consists of 13 general national objectives, based on which 39 specific targets have been formulated concerning the following: (i) enhancement of scientific knowledge, (ii) conservation of national natural capital, (iii) national system of protected areas, (iv) conservation of genetic resources, (v) synergistic policies for biodiversity conservation, (vi) conservation of landscape diversity, (vii) biodiversity and climate change, (viii) biodiversity and invasive alien species, (ix) international and transboundary conservation, (x) public administration and biodiversity protection, (xi) integration of biodiversity conservation into societal value systems, (xii) public participation in

biodiversity conservation, and (xiii) assessment of ecosystem services and promotion of the importance of Greek biodiversity. The 13 general national objectives of Greece correspond both to the Aichi Biodiversity Targets and to the EU Biodiversity Goals. The strategy is expected to be revised and amended every five years, with action plans developed on a five-year basis. Actions have been set to achieve the 39 specific targets during the first five-year period (2014–2019), along with some indicative implementation indicators. The Ministry of Environment and Energy is the competent authority responsible for the implementation of the National Biodiversity Strategy.

The Project is compatible with and does not conflict with the guidelines and objectives of the Biodiversity Convention.

### 5.3.2.8 Ramsar Convention

The Convention on Wetlands of International Importance, especially as Waterfowl Habitat, known as the "Ramsar Convention" — named after the Persian city where it was signed in 1971 — provides for the protection of wetland ecosystems.

*According to Article 1 of the Convention, wetlands are defined as: "...natural or artificial areas consisting of marshes with herbaceous vegetation, non-exclusively rain-fed marshes with peat substrate, peatlands, or water. These areas are permanently or temporarily flooded with water, which may be stagnant or flowing, fresh, brackish, or salty, and also include those covered by seawater with a depth at low tide not exceeding six meters. Wetlands may also include riparian or coastal zones adjoining wetlands or islands or marine water bodies that are deeper than six meters at low tide..."*

The Convention was ratified by Greece through Legislative Decree 191/1974 (GG 350/A/20.11.1974), which was later amended by Law 1751/1988 (GG 26/A/02.09.1988) and Law 1950/1991 (GG 84/A/31.05.1991) "On the Ratification of the Amendments to the Ramsar Convention. "The Greek wetlands designated as wetlands of international importance (Ramsar wetlands) since August 21, 1975, are 10 and cover an area of 1,635,010 square meters.

It should be noted that by signing and ratifying the Ramsar Convention, Greece has committed to the conservation and sustainable use of all its wetlands through local, regional, and international activities and collaborations.

Figure 5-9: Ramsar sites in the broader study area (Source: LDK).

The Project is compatible with and does not conflict with the guidelines and objectives of the present Convention, since neither the onshore nor the offshore parts of the Project fall within any Ramsar Wetland, as presented in Figure 5-9.

### 5.3.2.9 Agreement for the Establishment of the General Fisheries Commission for the Mediterranean (GFCM)

The Agreement for the Establishment of the General Fisheries Commission for the Mediterranean (GFCM) is a binding international treaty established under Article XIV of the Food and Agriculture Organization (FAO)

Constitution. It was adopted in 1949 and entered into force in 1952. The treaty's primary objective is to ensure the long-term conservation and sustainable use of marine living resources, as well as the protection of marine ecosystems across the Mediterranean and Black Sea regions. To that direction the GFCM 2030 Strategy has been implemented to provide a shared vision for achieving sustainable fisheries and aquaculture in the Mediterranean and Black Sea. It aligns national, regional, and global commitments and addresses the environmental, economic, and social dimensions of sustainability, with a strong focus on building resilience to future challenges.

The Strategy is organized around five strategic targets:

44. **Healthy Seas and Sustainable Fisheries** - Promotes an ecosystem-based approach to fisheries management by conserving biodiversity, improving scientific research and data collection, and ensuring fish stocks are harvested at sustainable levels.
45. **Compliance and Enforcement** - Strengthens monitoring, control, and enforcement systems to combat illegal, unreported, and unregulated (IUU) fishing. It seeks to harmonize compliance measures across countries and ensure that only legally caught fish enter markets.
46. **Sustainable and Resilient Aquaculture** - Supports responsible growth of aquaculture through improved governance, investment frameworks, technological innovation, and the sharing of best practices, while enhancing the sector's resilience and sustainability.
47. **Improved Livelihoods and Decent Employment** - Aims to increase the profitability and long-term viability of fisheries, particularly small-scale fisheries, by improving incomes, diversifying economic activities, strengthening social protection, and encouraging stakeholder participation in management decisions.
48. **Capacity Development and Partnerships** - Enhances technical cooperation, knowledge sharing, and collaboration among governments, fishers, researchers, NGOs, and other stakeholders. It focuses on building national and subregional capacities to effectively implement GFCM commitments and ensure consistent standards across the region.

The GFCM is taking a subregional approach to achieve sustainable fisheries and aquaculture development in the Mediterranean and Black Sea.

The technical units promote cooperation and facilitate dialogue on major issues and cross-border challenges, considering the needs and characteristics of each subregion. In practical terms, the units provide strategic and technical assistance to help countries effectively meet their commitments to the GFCM.

Its area of application is divided into five subregions: the western, central and eastern Mediterranean, the Adriatic Sea and the Black Sea as presented in Figure 5-10 .

**Figure 5-10: GFCM subregions (Source: Food and Agriculture Organization of the United Nations)**

These subregions are then divided into 30 geographical subareas (GSAs). The Project area falls within GSA 19 – Western Ionian Sea as presented in Figure 5-11 below.

Greece became a contracting party to the General Fisheries Commission for the Mediterranean (GFCM) shortly after the Agreement entered into force by depositing its instrument of acceptance on 7 April 1952. As a member, Greece participates in regional cooperation for the conservation and sustainable management of fisheries resources in the Mediterranean and Black Sea and is bound by the Commission's applicable conservation and management measures. The country also participates in the implementation of subsequent amendments to the GFCM Agreement adopted under its legal framework.

**Figure 5-11: GSA in the broader study area (Source: Food and Agriculture Organization of the United Nations)**

Partnerships are crucial to the work of the GFCM, both to implement actions on the ground and to share and develop knowledge and best practices across the region. Partners with a memorandum of understanding are the following:

- [ACCOBAMS](#) – Agreement on the Conservation of Cetaceans of the Black Sea, Mediterranean Sea and Contiguous Atlantic Area
- [AOAD](#) – Arab Organization for Agricultural Development
- [ATLAFCO](#) – Ministerial Conference on Fisheries Cooperation Among African States Bordering the Atlantic Ocean
- [Black Sea Commission](#) – The Commission on the Protection of the Black Sea Against Pollution
- [CIHEAM-IAMZ](#) – Mediterranean Agronomic Institute of Zaragoza (IAMZ) of the International Centre for Advanced Agronomic Mediterranean Studies (CIHEAM)
- [Eurofish](#) – International Organisation for the Development of Fisheries in Central and Eastern Europe
- [ICES](#) – International Council for the Exploration of the Sea
- [INFOSAMAK](#) – Centre for Marketing, Information and Advisory Services for Fishery Products in the Arab

#### Region

- [IUCN-Med](#) – International Union for Conservation of Nature – Centre for Mediterranean Cooperation
- [Med-AC](#) – Mediterranean Advisory Council
- [MedPAN](#) – Network of Marine Protected Area Managers in the Mediterranean
- [NEAFC](#) – North-East Atlantic Fisheries Commission
- [OceanCare](#)
- [UfM](#) – Union for the Mediterranean
- [UNEP-MAP](#) – United Nations Environment Programme – Mediterranean Action Plan for the Barcelona Convention
- [WWF](#) – World Wide Fund for Nature.

#### 5.3.2.10 European Council Regulation (EC) 2371/2002 on the conservation and sustainable exploitation of fisheries resources under the Common Fisheries Policy

---

The Council Regulation (EC) No 2371/2002 of 20 December 2002 on the conservation and sustainable exploitation of fisheries resources under the Common Fisheries Policy has application to the conservation of common dolphins in the Mediterranean. This arises from the powers and duties the Regulation provides to EC institutions regarding fisheries conservation (coupled with integration of environmental protection requirements) and from the powers the Regulation provides to Member States (coupled with the access restriction in case of waters within 12 nautical miles of coastal Member States’).

### 5.3.3 National Environmental Protection Objectives Relevant to the Project

#### 5.3.3.1 National Climate Law (Law 4936/2022)

---

The National Climate Law (Law 4936/2022, GG A' 105) establishes a modern framework for climate change adaptation in Greece. It introduces measures and policies to strengthen adaptation to climate change, procedures for their evaluation and the adoption of additional measures, as well as a governance and stakeholder participation framework to support climate action.

49. Articles 4, 5, and 6 of the National Climate Law provide for the preparation, evaluation, and periodic revision of the National Strategy for Climate Change Adaptation (NASCCA) by the Ministry of Climate Crisis and Civil Protection, as well as the preparation, evaluation, and revision of the 13 Regional Climate Change Adaptation Plans (RAPs) by the respective Regional Authorities. Article 34 establishes transitional provisions for the approval of Regional Adaptation Plans whose preparation had already commenced under the previous legislative framework.
50. Article 9 sets out additional adaptation actions and resilience measures, requiring all central government bodies to integrate climate change adaptation into their strategic and operational planning through appropriate adaptation and resilience-building actions. Furthermore, Article 10 enables the adoption and implementation of policies and measures to strengthen resilience and reduce climate vulnerability across all sectors of the economy, the natural environment, and biodiversity.

51. Article 18 strengthens the integration of climate change adaptation into the environmental permitting process by requiring Environmental Impact Assessments (EIAs) to include an assessment of the project's vulnerability to climate change. Specifically, EIAs must describe climate-related hazards, undertake a climate risk assessment, evaluate potential impacts, and identify measures to enhance the resilience of the project under both current and future climate conditions.
52. Article 25 establishes the National Observatory for Climate Change Adaptation within the Ministry of Climate Crisis and Civil Protection. The Observatory serves as an open information-sharing and knowledge platform involving the Ministries of Climate Crisis and Civil Protection, Environment and Energy, Interior, the Hellenic National Meteorological Service, the National Observatory of Athens, and other research, academic, and public institutions.
53. Article 27 requires the preparation of an annual progress report, including a description of adaptation actions and progress achieved across different sectors.
54. Finally, Article 28 establishes the National Council for Climate Change Adaptation, which serves as the State's principal advisory body responsible for coordinating, monitoring, adopting, and evaluating climate change adaptation policies. Article 29 establishes the Scientific Committee on Climate Change within the Ministry of Environment and Energy, which acts as the Government's technical and scientific advisory body on climate change adaptation and mitigation.

The Project has considered the requirements and objectives of the National Strategy for Climate Change Adaptation (NSCCA) and the Regional Adaptation Plan (RAP) of Epirus in its design and impact assessment process. Climate-related risks, vulnerabilities and adaptation measures have been assessed as part of the ESIA, and appropriate measures have been incorporated into the Project design where relevant. On this basis, the Project is considered consistent with the objectives of the NSCCA and the RAP and is not expected to conflict with their implementation.

### 5.3.3.2 National Strategy for Climate Change Adaptation (onshore facilities)

Articles 42–44 of Law 4414/2016 established the initial institutional framework for climate change adaptation, the key elements of which included the National Strategy for Climate Change Adaptation, the Regional Climate Change Adaptation Plans, the National Council for Climate Change Adaptation, and the Special Scientific Committee for Climate Change Mitigation.

*Article 45 of Law 4414/2016 approved the first National Strategy for Climate Change Adaptation (NASCCA).* The NASCCA sets out the general objectives, guiding principles, and implementation tools of a modern, effective, and development-oriented adaptation strategy to climate change, within the framework defined by the United Nations Framework Convention on Climate Change, European policies, and international experience. NASCCA proposes indicative adaptation actions and measures covering a broad range of environmental, economic, and social sectors that are expected to be significantly affected by climate change.

The NASCCA is implemented through 13 Regional Climate Change Adaptation Plans (RAPs). The RAPs specify the directions of the NASCCA by assessing climate vulnerability and defining appropriate adaptation actions and measures, based on the specific characteristics of each Region.

Articles 42–44 of Law 4414/2016 have now been repealed; however, their provisions concerning the NASCCA, the RAPs, and the National Council for Climate Change Adaptation have been largely retained and incorporated into Articles 4, 5, 6, and 28 of the National Climate Law (Law 4936/2022). At the same time, the Special Scientific Committee for Climate Change Mitigation was transformed into the Scientific Committee on Climate Change (Article 29 of the National Climate Law), expanding its mandate to include climate change mitigation issues.

Within the framework of the National Climate Law (Articles 9 and 10), further promotion is made of climate change adaptation and resilience-building at sectoral level, in line with the relevant provisions of the European Climate Law. Specifically, an obligation is introduced for central administration bodies to integrate climate change adaptation into their strategic and operational planning, while also enabling the implementation of measures and policies to strengthen resilience and reduce vulnerability across all sectors of the economy and the natural environment.

In addition, Article 25 of the National Climate Law establishes the National Observatory for Climate Change Adaptation, part of which will be the present National Information Web Portal for Climate Change Adaptation.

National Strategy for Climate Change Adaptation (NASCCA) aims to establish a coordinated national framework for enhancing Greece's resilience to climate change. Its main objectives are to:

- improve and systematise decision-making processes related to climate change adaptation in both the short and long term;
- integrate climate change adaptation into sustainable development through regional and local action plans;
- promote adaptation measures and policies across all sectors of the Greek economy, with particular emphasis on the most climate-vulnerable sectors;
- establish mechanisms for monitoring, evaluating, and periodically updating adaptation measures and policies; and
- strengthen the adaptive capacity of Greek society through awareness-raising, education, and stakeholder engagement.

The current NASCCA identifies indicative adaptation measures and actions for 15 priority sectors:

- Agriculture and livestock;
- Forestry;
- Biodiversity and ecosystems;
- Fisheries;
- Aquaculture;
- Water resources;
- Coastal zones;
- Tourism;
- Energy;
- Infrastructure and transport;
- Human health;

- Built environment;
- Extractive industries;
- Cultural heritage; and
- Insurance.

The NASCCA is a strategic policy document that provides national guidance and establishes the overall direction for climate change adaptation. It does not prescribe detailed sector-specific policies or prioritise adaptation measures at the local or regional level. These functions are undertaken through the Regional Climate Change Adaptation Plans (RAPs), which translate the Strategy into region-specific priorities and actions based on local climate vulnerabilities.

Under Article 3 of Law 4936/2022, which replaced the former Article 42 of Law 4414/2016, the NASCCA must include, as a minimum:

- an analysis of the Strategy's objectives and guiding principles in accordance with international agreements and European Union climate policy;
- an assessment of projected climate change under different climate scenarios, including vulnerability analyses of economic sectors, social activities, and the natural and built environment, together with an assessment of the associated socio-economic impacts;
- identification of priority sectors requiring adaptation measures, including proposals for adaptation actions relating, at a minimum, to health, tourism, agriculture, livestock, forestry, energy, insurance, infrastructure and transport, the built environment, biodiversity, ecosystems, water resources, coastal zones, and cultural heritage;
- a preliminary assessment of adaptation costs;
- integration of climate adaptation into broader national policies;
- consideration of the international dimension of adaptation policy; and
- proposals for awareness-raising, education, and research activities.

This framework ensures that climate change adaptation is systematically incorporated into national, regional, and sectoral planning and provides the basis for integrating climate resilience into projects requiring Environmental Impact Assessment (EIA).

The Regional Plans for Climate Change Adaptation (RePCCA), based on the climate conditions and vulnerability of each region, precisely determine the policy sectors and geographic priority areas for action, specifying the measures, financial instruments for implementation, responsible bodies, and involved stakeholders.

The objectives of the Regional Climate Change Adaptation Plan (RAP) for the Region of Epirus are based on the European Union and national climate change adaptation strategies and are aimed to:

1. Analyse the sector-specific policies required for climate change adaptation;
2. Assess the feasibility of individual adaptation measures and actions at the local and regional levels;
3. Select the most appropriate adaptation measures;
4. Prioritise the proposed adaptation measures and actions;

5. Establish an implementation timetable;
6. Identify funding sources and implementation mechanisms; and
7. Apply indicators and other monitoring tools to assess the implementation and effectiveness of adaptation measures.

The Epirus RAP places particular emphasis on sectors considered to be of strategic importance to the Region, namely:

- agriculture;
- the experience economy (tourism);
- transport infrastructure;
- forestry

The proposed Project is considered consistent with the directions and objectives of both the National Strategy for Climate Change Adaptation (NSCCA) and the Regional Plan for Climate Change Adaptation (RAP) of Epirus and advances their goals.

### 5.3.3.3 National Energy and Climate Plan

*By Decision 3/18.12.2024 of the Government Council for Economic Policy (GG B' 4893), the National Energy and Climate Plan (NECP) was ratified.*

The National Energy and Climate Plan (NECP) constitutes the Greek Government's principal strategic framework for climate and energy policy. It provides a comprehensive roadmap for achieving specific national energy and climate targets by 2030. The NECP sets out priorities and policy measures across a broad range of economic and development sectors, with the aim of supporting sustainable economic growth, enhancing energy security, and facilitating Greece's transition to a low-carbon economy. As such, it serves as the key national reference document for energy and climate policy over the current decade.

Complementing the NECP is the Long-Term Strategy for 2050, which provides a strategic roadmap for climate and energy policy beyond 2030. The Long-Term Strategy supports Greece's contribution to the European Union's objective of achieving a climate-neutral economy by 2050 and builds upon the successful implementation of the NECP and the achievement of its 2030 targets.

The main targets of the NECP for 2030 are as follows:

- Share of RES > 35% of Gross Final Energy Consumption
- Share of RES 61–64% of Gross Final Electricity Consumption
- Final Energy Consumption 16.1–16.5 Mtoe (>38% compared to 2007 projections)
- Zero lignite participation in electricity generation
- 42% GHG reduction compared to 1990, >56% compared to 2005

The NECP prioritizes, in terms of planned policies and implementation of specific measures, the achievement of specific targets regarding energy supply security, the operation of energy markets and the role of consumers, the enhancement of the competitiveness of the economy, as well as the promotion of research and innovation actions.

Specifically, the NECP sets for 2030 significantly higher central targets for climate change and emissions, with reductions exceeding 42% compared to 1990 emissions and over 56% compared to 2005 emissions, even surpassing central European targets. It is noteworthy that in the initial NECP draft, these targets were significantly lower, resulting in reductions of 33% and 49%, respectively. These new targets are also necessary to enable the transition to a climate-neutral economy by 2050, as the Greek Government aims to participate proportionally in the commitment for a climate-neutral economy at the EU level.

At the same time, regarding Climate Change and adaptation policies, the NECP presents the initiatives to be undertaken within the framework of the National Strategy for Climate Change Adaptation (NSCCA), which defines general objectives, guiding principles, and the tools for implementing necessary climate adaptation measures at national, regional, and local levels.

To achieve the above targets, the NECP text presents and analyzes the individual Policy Priorities for the next period as well as the corresponding Policy Measures designed to implement the priorities and achieve the NECP targets, across seven thematic areas:

- Climate Change, GHG Emissions and Removals
- Renewable Energy Sources
- Energy Efficiency Improvement
- Energy Supply Security
- Energy Market
- Agriculture, Shipping, Tourism (new thematic area)
- Research, Innovation, and Competitiveness

Regarding the specific Project, according to the NECP, the recognition of potential and the optimal economic utilisation of domestic energy sources is a key objective and priority for the development of the national energy system. Although under a different policy approach and planning logic, the exploration for the extraction and exploitation of domestic hydrocarbon deposits continues to constitute a pillar of energy policy for the coming period and is integrated into the broader framework of the utilisation of domestic energy resources.

Moreover, further on the hydrocarbon E&P field, measures and policies for energy security have been established mainly highlighting the development of domestic hydrocarbon deposits as Greece continues to be an emerging market in the exploration and production of natural gas in the Eastern Mediterranean. Both the hydrocarbons exploration and exploitation programme in Greece, as well as the transnational pipeline projects TAP (Trans Adriatic Pipeline), the Greece–Bulgaria interconnector (IGB), and the EastMed pipeline, constitute important projects that strengthen the diversification of the EU energy supply and ensure security of supply in order to reduce energy dependence on third countries.

The State places particular emphasis on issues of safety related to hydrocarbon exploration and exploitation and, by extension, environmental protection. Environmental risks are assessed by the competent services of the Ministry of Environment and Energy, which sets the terms and conditions and approves the execution stages.

The Hellenic Hydrocarbons and Energy Resources Management Company SA (EDEYEP), as the competent authority, monitors, among other things, the implementation of these contractual obligations by contractors

and their partners and intervenes in cases of deviations from any party. A conservative estimate of the potential and probable reserves in these areas, where no exploration drilling has yet been carried out, ranges at 24 trillion cubic feet (Tcf) or 680 bcm, according to preliminary data from EDEYEP. The possible confirmation of these deposits would fully cover both current and future domestic hydrocarbon demand, rendering the country an exporter by the end of the decade.

Complementary to the NECP, the Long-Term Strategy for 2050 (LTS 2050) is developed, constituting a roadmap for Climate and Energy issues within Greece's participation in the collective European target of a successful and sustainable transition to a climate-neutral economy by 2050 at the EU level.

The Long-Term Strategy toward 2050 climate neutrality includes key policies categorized into the following axes:

- Energy Efficiency Improvement
- Electrification of Transport and Heat
- Renewable Energy Sources
- Clean Mobility in Transport
- Industrial Competitiveness and Climate Neutrality
- Infrastructure in Networks and Market Integration Policies
- Bioeconomy

The proposed offshore hydrocarbon exploration project is broadly consistent with the objectives of Greece's National Energy and Climate Plan (NECP) by supporting the security and diversification of the national energy supply during the transition towards a climate-neutral economy. While the NECP prioritises the accelerated deployment of renewable energy and the reduction of greenhouse gas emissions, it also recognises the importance of maintaining energy security and resilience throughout the transition. The project seeks to evaluate potential domestic hydrocarbon resources, which could contribute to reducing reliance on imported fossil fuels in the event of a commercial discovery.

The exploration activities will be undertaken in accordance with applicable national and European environmental legislation, incorporating measures to minimise greenhouse gas emissions, prevent pollution, and protect the marine environment, thereby supporting the NECP's broader objectives of sustainable energy development and environmental protection.

#### 5.3.3.4 National Maritime Spatial Strategy (NMSS)

The National Maritime Spatial Strategy (NMSS), approved by Act of the Cabinet 6/17.04.2025 (GG D 227/2025), constitutes the highest-level strategic planning instrument for Greece's maritime space and forms an integral part of the National Spatial Strategy established under Law 4447/2016. The NMSS establishes:

- strategic directions for offshore energy;
- coexistence of maritime uses;
- protection of marine ecosystems;
- fisheries and aquaculture considerations;

- maritime transport corridors;
- marine cultural heritage;
- cross-border maritime interactions

In a nutshell the strategy provides the long-term vision, strategic objectives, and guiding principles for the sustainable organization, management, and development of Greece's marine areas, while ensuring coherence between maritime and terrestrial planning. It provides a framework for balancing economic development, environmental protection, social interests, and national priorities within the maritime domain. The Strategy addresses the interactions between marine and coastal areas and promotes the coordinated management of activities that have spatial implications at sea.

To achieve this, it identifies maritime spatial units as the basis for future Maritime Spatial Planning Frameworks and sets priorities for their preparation. The NMSS also seeks to ensure the coexistence and compatibility of multiple maritime uses, including maritime transport and ports, fisheries, aquaculture, tourism and recreation, offshore energy development, submarine cables and pipelines, marine mineral and hydrocarbon resources, defense and security activities, and scientific research.

At the same time, it incorporates environmental objectives relating to the protection of marine ecosystems, biodiversity, Natura 2000 sites, marine protected areas, cultural and underwater heritage, climate-change adaptation, ecosystem resilience, and the achievement of Good Environmental Status under the Marine Strategy Framework Directive. Furthermore, the Strategy promotes integrated coastal zone management, considers transboundary interactions with neighboring states, and provides the strategic basis for the preparation of Maritime Spatial Planning Frameworks at sub-regional, regional, or inter-regional level. In doing so, it serves as the principal mechanism for coordinating sectoral policies and investment programmes that influence the maritime environment, including national energy policy, port development, fisheries management, environmental conservation, island policy, emergency management, and climate adaptation planning, thereby ensuring the sustainable and orderly development of Greece's maritime space.

Offshore hydrocarbon exploration and production is recognized by the NMSS as a specific objective for the promotion of maritime development and a potentially important activity contributing to national energy security and energy supply objectives, as reflected in the Revised National Energy and Climate Plan (NECP 2024). However, the Strategy emphasizes that any hydrocarbon-related activities should be planned, developed, and implemented in a manner that minimizes adverse impacts on both the natural environment and human activities, ensuring compatibility with environmental protection objectives and other maritime uses.

### 5.3.3.5 Designation of Maritime Spatial Units (MSUs)

Maritime Spatial Units (MSUs) adopted through Ministerial Decision ΥΠΕΝ/ΔΧΩΠΣ/43090/574/17.04.2025 (GG D 229/2025), are geographically defined marine planning areas established under the NMSS to serve as the spatial basis for the preparation of MSPFs. They are intended to group areas with similar environmental, economic, and planning characteristics, thereby enabling the coordinated management of maritime activities and the sustainable use of marine resources. For the purposes of maritime spatial planning, the Asopos-1 exploration well is located within the Northern Ionian Maritime Spatial Unit (MSU 4), as presented in Figure 5-12 overleaf.

Spatial Unit 4, covers the maritime area of western Greece, including the Adriatic, Ionian Sea, and Central Mediterranean marine regions where Greece exercises sovereign rights and jurisdiction in accordance with national legislation. The unit encompasses the offshore waters adjacent to the Regions of Western Greece, Epirus, and the Ionian Islands, as well as portions of the Peloponnese, Central Greece, and Attica.

The Asopus-1 exploration well, located west of Kerkyra (Corfu) in Block 2, falls within this Maritime Spatial Unit and is therefore subject to the strategic directions and planning objectives applicable to Spatial Unit 4 under the National Maritime Spatial Strategy.

**Figure 5-12: Greece's Maritime Spatial Units (MSUs) as defined within the Act of the Cabinet 6/17.04.2025 approving the National Maritime Spatial Strategy (GG Δ' 227/2025).**

### 5.3.3.6 Maritime Spatial Planning Frameworks

The Technical Specifications for the Maritime Spatial Planning Frameworks (MSPFs), adopted through Ministerial Decision ΥΠΕΝ/ΔΧΩΠΣ/43091/575/17.04.2025 (GG D 228/2025), establish the methodology, content, analytical requirements, and preparation procedures for Maritime Spatial Planning Frameworks

under Law 4546/2018. They provide the technical and procedural guidance required for the preparation of maritime spatial plans within the Maritime Spatial Units defined by the National Maritime Spatial Strategy.

The Technical Specifications define:

- the objectives and principles of maritime spatial planning.
- the structure and content of Maritime Spatial Planning Frameworks.
- the spatial scales at which planning is to be undertaken.
- the data collection and analysis requirements.
- the assessment of existing and future maritime uses and activities.
- the identification of conflicts, synergies, and cumulative pressures among maritime sectors.
- the consideration of land-sea interactions.
- environmental, social, economic, and cultural parameters to be considered.
- stakeholder consultation requirements; and
- the preparation of maps, zoning proposals, and spatial management measures.

The document is intended to ensure a consistent methodology for the preparation of Maritime Spatial Planning Frameworks throughout Greece and to facilitate the coordinated management of activities such as offshore energy development, maritime transport, fisheries, aquaculture, tourism, environmental protection, and cultural heritage.

The well is located within the Northern Ionian Maritime Spatial Unit, for which no dedicated Maritime Spatial Planning Framework has yet been adopted. Consequently, project compatibility should be assessed against the NMSS strategic objectives and the relevant sectoral frameworks.

### 5.3.4 Legislative Framework for Energy Security

#### 5.3.4.1 Treaty on the Functioning of the European Union (TFEU)

Energy security and diversification of supply are established as fundamental objectives of European Union energy policy under *Article 194 of the Treaty on the Functioning of the European Union (TFEU)*<sup>20</sup>, which provides that Union policy shall aim to ensure the functioning of the energy market, security of energy supply within the Union, promote energy efficiency and savings, and the development of new and renewable forms of energy.

The aim of the article is to highlight that *“the need to preserve and improve the environment, Union policy on energy shall aim, in a spirit of solidarity between Member States, to:*

- a) ensure the functioning of the energy market;
- b) ensure security of energy supply in the Union;
- c) promote energy efficiency and energy saving and the development of new renewable forms of

<sup>20</sup> Treaty on the Functioning of the European Union (Consolidated Version) [2016] OJ C202/1, art 194.

energy; and

- d) promote the interconnection of energy networks”

while following the above specifies that “such measures shall not affect a Member State's right to determine the conditions for exploiting its energy resources, its choice between different energy sources and the general structure of its energy supply”.

#### 5.3.4.2 Regulation (EU) 2017/1938

The objectives of energy security and diversification are further operationalised through **Regulation (EU) 2017/1938 concerning measures to safeguard the security of gas supply**. The aforementioned, establishes a legally binding framework requiring Member States to ensure secure gas supply to protected customers, undertake national risk assessments, develop preventive action plans and emergency plans, and apply infrastructure resilience standards<sup>21</sup>.

Annex IV of Regulation (EU) 2017/1938 establishes the N-1 infrastructure standard, requiring Member States to demonstrate that total gas demand can be met even in the event of disruption of the single largest gas infrastructure element. Within this framework, domestic gas production is explicitly included as a system input parameter in the calculation of supply adequacy.

This approach effectively defines energy security as a function of diversified and resilient supply components, including imports, storage, LNG capacity, and indigenous production. In systems characterised by high import dependency, the absence of domestic production capacity represents a structural limitation in resilience modelling.

In this context, exploration activities contribute to the evaluation of potential domestic production and therefore support long-term system-level assessments of supply security, without pre-empting development decisions. The generation of subsurface data through exploration is thus consistent with the objectives of Regulation (EU) 2017/1938 insofar as it enables informed evaluation of future supply diversification options within the N-1 resilience framework.

#### 5.3.4.3 European Energy Security Strategy (2014) & REPowerEU Plan (2022)

EU energy security policy is further supported by the European Energy Security Strategy (2014)<sup>22</sup> and the REPowerEU Plan (2022)<sup>23</sup>, which prioritise diversification of energy sources and routes, reduction of dependency on external suppliers, and strengthening of domestic energy system resilience within the Union.

More specifically the European Energy Security Strategy regarding hydrocarbons, highlights that key priority actions for Member States, should be:

- Exploiting, where this option is chosen, hydrocarbons and clean coal considering the decarbonisation priorities.

<sup>21</sup> Regulation (EU) 2017/1938 of the European Parliament and of the Council of 25 October 2017 concerning measures to safeguard the security of gas supply [2017] OJ L280/1.

<sup>22</sup> European Commission, European Energy Security Strategy COM(2014) 330 final

<sup>23</sup> European Commission, REPowerEU Plan COM(2022) 230 final

- Streamlining national administrative procedures for hydrocarbon projects, including by carrying out Strategic Impact Assessments and setting up one-stop shop for granting permitting procedures, in accordance with the Commission's guidance documents on Streamlining environmental assessment procedures for energy infrastructure and Projects of Common interest and on EIAs for large scale trans-boundary projects 25.
- Assessing the potential of unconventional hydrocarbons taking full account of Recommendation 2014/70/EU, in order to ensure that the highest environmental standards are implemented.
- Supporting demonstration projects for carbon capture and storage, particularly those co-financed by the NER 300 Programme and the European Energy Programme for Recovery, such as the ROAD project.

Moreover, the strategy identifies the Commission as the entity responsible to:

- Launch a European science and technology Network on unconventional hydrocarbon extraction.
- Organise an exchange of information between Member States, the relevant industries and non-governmental organisations promoting environmental protection in order to draw up Best Available Techniques (BAT) reference documents on hydrocarbons exploration and production (BREF);
- Ensure the full implementation and review of the CCS Directive and take a decision on the second round of awards under the NER 300 Programme.

Figure 5-13: Set of actions put forward by REPowerEU<sup>23</sup> Plan

#### 5.3.4.4 Transposition into Greek Law

The above EU legal framework is transposed into Greek legislation primarily through *Law 4001/2011 on the Operation of Energy Markets and Hydrocarbon Regulation*, which establishes the national regulatory framework for the organisation, supervision and security of energy supply systems in Greece<sup>24</sup>. This law incorporates EU energy market principles and provides the legal basis for the regulation of gas infrastructure, system operation, and energy security obligations consistent with EU law.

<sup>24</sup> Law 4001/2011 (Greece) on the Operation of Energy Markets and Hydrocarbon Regulation (GG A' 179/2011)

Further implementation is supported through the National Energy and Climate Plan (NECP 2021–2030)<sup>25</sup>, which constitutes the primary strategic planning instrument for energy policy in Greece and operationalises EU energy and climate objectives at national level. The NECP integrates EU requirements on diversification of energy supply, infrastructure resilience, and security of supply planning in accordance with Regulation (EU) 2017/1938.

Greece's NECP identifies energy security of supply as a central policy objective, reflecting the country's continued reliance on imported fossil fuels, particularly natural gas and oil. This structural import dependency exposes the energy system to external market volatility and geopolitical risk, and underpins policy efforts to diversify energy sources, expand renewable energy deployment, and strengthen regional interconnections.

Within this strategic context, offshore hydrocarbon exploration activities such as the Asopus-1 well are considered part of a broader resource assessment and energy diversification agenda (Figure 5-14), aimed at evaluating potential indigenous hydrocarbon resources that could contribute (if commercially viable) to enhancing long-term supply security and reducing import exposure. At the same time, the NECP trajectory clearly prioritises decarbonisation and renewable energy expansion, meaning that any potential contribution from domestic hydrocarbons would be transitional and subject to strict environmental and safety constraints. Accordingly, offshore exploration activities must be assessed within a dual framework: (i) their potential contribution to national energy security objectives through improved resource knowledge and possible future supply diversification, and (ii) their environmental and climate implications, which must be managed consistently with Greece's long-term decarbonisation commitments and EU climate policy objectives.

---

<sup>25</sup> Hellenic Republic, National Energy and Climate Plan (NECP) (Ministry of Environment and Energy, 2024)

(Source: HEREMA)

Figure 5-14: Hydrocarbon exploration blocks in Greece.

Finally, throughout the section, it is made clear that Greece's hydrocarbon exploration programme could offer a combination of economic, strategic, and energy-related benefits. It is expected to create employment opportunities and support the development of specialised skills, strengthening the country's human capital. At the same time, potential discoveries could enhance Greece's energy security and diversification, reinforcing its role in the Eastern Mediterranean energy system and contributing to EU supply during the energy transition. The programme is supported by strong institutional oversight from bodies such as the Hellenic Hydrocarbons and Energy Resources Management Company (HEREMA) and the Ministry of Environment and Energy (YPEN), ensuring high standards of environmental protection and safety. Additionally, revenues may support regional development and help mitigate the socio-economic impacts of the transition away from lignite, contributing to a more balanced and sustainable energy transition.

The proposed Project supports the objectives of energy security and diversification through the evaluation of domestic hydrocarbon resources within Block 2. While the Project is limited to exploration activities and does not include hydrocarbon production, successful identification of commercially recoverable resources could, subject to further appraisal, development decisions and regulatory approvals, contribute to future economic benefits for Greece through taxation, royalties and other revenues associated with hydrocarbon production.

In this context, any future revenues could support national economic development objectives, including initiatives related to the energy transition and support for local and regional economies.

## 5.4 Standards of international industry and international financial institutions

### 5.4.1 Good Oilfield Practice (GOP) and Good International Industry Practice (GIIP)

The term "Good Oilfield Practice" is used by certain national oil and gas regulatory authorities to describe the approach expected from operators working in their jurisdictions. Unfortunately, it is not a clearly defined concept, and as such, its meaning can be interpreted in different ways.

A commonly accepted definition of "Good Oilfield Practice" is the following:

*"The practices and procedures used in the oil industry worldwide by prudent and diligent operators under conditions and circumstances related to Hydrocarbon Activities, primarily aiming to ensure:*

- Sustainable viability achieved through resource preservation of oil and natural gas, implying the use of appropriate methods and procedures to maximize hydrocarbon recovery in a technically and economically viable way, with corresponding control of reserve decline and minimization of surface losses,
- Operational safety, involving the use of methods and procedures that promote occupational safety and accident prevention,
- Environmental protection, which requires the adoption of methods and procedures that minimize the impact of Hydrocarbon Activities on the environment."

"Good International Industry Practice (GIIP)" is defined as follows:

*"The exercise of professional skill, diligence, prudence, and foresight that would reasonably be expected from skilled and experienced professionals engaged in the same type of undertaking under the same or similar circumstances globally. Circumstances that skilled and experienced professionals may consider when assessing the range of available pollution prevention and control techniques may include, but are not limited to, varying levels of environmental degradation and assimilative capacity, as well as differing levels of economic and technical feasibility."* The World Bank Group's Health, Safety & Environmental (HSE) Guidelines, established in 2007, are technical reference documents that provide examples of approaches based on Good International Industry Practice. The Equator Principles and the Performance Standards of the International Finance Corporation (IFC) refer to these guidelines when defining acceptable performance levels.

In contrast, there are no strict guidelines or established rules that define how "good oilfield practice" is achieved or how performance against such a standard can be measured. Good Oilfield Practice does not concern the adherence to a specific procedure, but rather the approach an operating company takes in carrying out its duties to the government that granted its license. By definition, adherence to the principles of Good International Industry Practice would constitute Good Oilfield Practice.

It is clearly a concept related to how a facility is designed, the methods of construction, operation, and maintenance, as well as how it is managed overall, and is thus equally applicable at every stage of the asset lifecycle.

Good Oilfield Practice is by definition an evolving concept. It requires operators to monitor successes and failures in the industry and adapt their internal practices accordingly. Regulators wish to avoid failures observed elsewhere in the world while ensuring that new, more effective approaches are implemented as soon as possible. Good Oilfield Practice equally promotes the use of recognized and well-proven Standards at the design stage, internal management/control procedures during project execution, and risk-based inspection systems during operations as a means of managing cost.

Energean is committed to adhering to Good Oilfield Practice throughout its day-to-day activities, whether drilling new wells, installing new facilities, or managing existing facilities. This commitment is demonstrated in the way new and existing projects have been formulated and implemented. Energean's projects have included:

- The hiring of international staff with proven experience in developing similar fields.
- The use of internationally recognized contractors for specialized technical and non-technical tasks.
- The identification of appropriate international and industry standards based on which new facilities will be designed and old ones assessed.
- The design of internal controls that allow project reviews and approvals as they pass through each decision-making stage. The upgrade of the newly acquired rig according to international standards, using OEM (Original Equipment Manufacturer) equipment and personnel.
- The early integration of risk reduction techniques in the design process.
- A desire to maximize the project's positive impact on the Greek economy by adapting the design to local industrial capabilities.

The Asopus-1 exploration drilling Project is directly related and compliant with Good Oilfield Practice (GOP), as it concerns hydrocarbon exploration by means of exploration well drilling from offshore facilities (drillship), operating under world-class standards to ensure complete safety and operational excellence. Both Good Oilfield Practice (GOP) and Good International Industry Practice (GIIP) are reflected in the project design, operational controls, environmental management measures, and decommissioning arrangements described in the ESIA.

The Project demonstrates GOP through the adoption of established offshore drilling practices and well integrity controls, including:

- Use of water-based muds (WBM) only and avoidance of oil-based muds or non-aqueous drilling fluids.
- Installation and operation of a subsea Blowout Preventer (BOP), marine riser system, and closed-loop mud circulation system for deeper hole sections.
- Continuous monitoring of drilling parameters, formation evaluation through logging-while-drilling (LWD) and mudlogging, and implementation of well control procedures.
- Capture and onshore disposal of any hydrocarbon-contaminated cuttings, rather than discharge to sea.
- Application of recognised plug and abandonment (P&A) practices, including installation of verified cement barriers.

- Management of drilling waste, hazardous waste, chemicals, and marine operations in accordance with recognised offshore industry procedures and vessel management systems.
- Emergency preparedness measures, including spill response procedures, well control contingencies, and incident reporting arrangements.

These measures are consistent with normal industry practice for deep-water exploration drilling and are intended to ensure safe and environmentally responsible well construction and abandonment.

The Project also incorporates GIIP by aligning with internationally recognised environmental, health, safety, and operational standards, including:

- Compliance with the Barcelona Convention Offshore Protocol and UNEP/MAP standards governing drilling-fluid and cuttings discharges in the Mediterranean. United Nations Environment Programme Mediterranean Action Plan
- Compliance with MARPOL Annex V (waste management) and MARPOL Annex VI (air emissions), including use of fuel meeting the Mediterranean Sulphur Emission Control Area requirements. International Maritime Organization
- Use of internationally recognised methodologies for emissions estimation, including the EMEP/EEA Air Pollutant Emission Inventory Guidebook.
- Application of environmental baseline surveys, seabed surveys, environmental impact assessment (ESIA), and risk assessment processes consistent with international lender and regulator expectations.
- Adoption of waste hierarchy principles through segregation, recycling, recovery, and transfer of wastes to licensed shore facilities.
- Preference for low-toxicity, low-bioaccumulation chemicals and implementation of chemical management procedures.
- Use of a structured HSE management framework, operational procedures, training, maintenance programmes, and contractor controls.
- Post-drilling seabed clearance surveys and removal of temporary offshore infrastructure.
- Consideration of emissions, waste, discharges, biodiversity, and marine environmental impacts throughout the project lifecycle.

The development and implementation of GOP for the Project will be guided by recognized international standards, including relevant publications of the International Association of Oil & Gas Producers (IOGP), the American Petroleum Institute (API), and the International Organization for Standardization (ISO). In particular, reference is made to [IOGP Report 485. Standards and Guidelines for Well Integrity and Well Control](#), which provides a consolidated framework of internationally accepted standards and recommended practices relating to well design, well integrity, barrier management, blowout prevention, well control operations, and competency assurance. The main elements of GOP are summarized in Table 5-11

**Table 5-11: Application of GOP in the Asopus-1 Project**

| GOP AREA                  | RELEVANT STANDARDS                                 | APPLICATION TO ASOPUS-1                                                                                                                                        |

## 5.4.2 Best Available Techniques (BAT)

### 5.4.2.1 Overview of Best Risk Management Approaches (BRMA) and Best Available Techniques (BAT)

The concept of Best Available Techniques (BAT), as incorporated within the broader European environmental legislation, is further elaborated and operationalized in the offshore industry through the European Commission's *"Best Available Techniques Guidance Document on Upstream Hydrocarbon Exploration and Production" (2019)*, which constitutes the most recent comprehensive European reference document concerning environmental protection practices applicable to offshore hydrocarbon activities. The Guidance Document was developed following a multi-year technical information exchange process involving EU Member States, regulatory authorities, industry representatives, and environmental stakeholders, with the objective of identifying and consolidating the most effective environmental management techniques and risk mitigation measures applicable to both onshore and offshore hydrocarbon exploration and production operations.

With regard to offshore exploration drilling activities, the BAT Guidance Document identifies a range of environmental aspects requiring the implementation of BAT, including the handling and management of drilling muds and drill cuttings, offshore chemical management, prevention of accidental spills and releases, control of atmospheric emissions, minimization of offshore discharges, energy efficiency, waste management, environmental monitoring, and risk-based operational planning. The Guidance Document emphasizes that offshore drilling activities should be designed and conducted through the application of integrated environmental management systems and operational controls intended to minimize risks to the marine environment throughout the entire lifecycle of the activity.

In particular, the BAT Guidance Document highlights the importance of implementing environmentally optimized drilling fluid systems, reducing the discharge of hazardous substances, applying robust well integrity and blowout prevention measures, ensuring proper containment and handling of chemicals, minimizing fugitive emissions, and establishing comprehensive monitoring and emergency response procedures.

More specifically, for upstream exploration and production of offshore hydrocarbons, Part Four of the guidance entails the following activities:

- 1) Handling of Drill Cuttings and Drilling Muds
- 2) Handling & Storage of Hydrocarbons
- 3) Handling and Storage of Chemicals
- 4) Energy Efficiency
- 5) Flaring and Venting

- 6) Management of Fugitive Emissions
- 7) Produced Water Handling and Management
- 8) Management of Drain Water
- 9) Facility Decommissioning
- 10) Environmental Monitoring.

Activities 5 (Flaring and Venting) and 7 (Produced Water Handling and Management) are not relevant to the Project, as these activities are not included in the exploration well operations.

For each activity, the document identifies either Best Available Techniques (BAT) and/or Best Risk Management Approaches (BRMA).

Table 5-12 provides a summary of proposed BATs and BRMAs associated with the Project.

**Table 5-12: Offshore activities covered within the Best Available Techniques Guidance Document on upstream hydrocarbon exploration and production**

| OFFSHORE ACTIVITY                             | BEST RISK MANAGEMENT APPROACHES (BRMA) /<br>BEST AVAILABLE TECHNIQUES (BAT)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

The document also promotes the selection and use of chemicals in accordance with harmonized environmental assessment systems such as the **Harmonised Offshore Chemical Notification Format (HOCNF)** and associated **Offshore Chemical Notification Scheme (OCNS)** procedures developed under the OSPAR framework.

#### 5.4.2.2 Compatibility assessment

The Project has been designed and will be implemented in a manner consistent with the principles and

recommendations set out in the European Commission BAT Guidance Document for Offshore Hydrocarbon Exploration and Drilling Activities. The Project incorporates internationally recognized engineering and operational standards, pollution prevention and control measures, environmentally responsible chemical selection and management procedures, drill cuttings and waste handling arrangements, spill prevention and emergency response systems, and continuous environmental monitoring programs intended to minimize potential impacts on the marine environment.

The compatibility of Project design with proposed risk management approaches and best available techniques for offshore activities is analysed in Table 5-13.

**Table 5-13: Compatibility of Project design with Best Risk Management Approaches and Best Available Techniques**

| OFFSHORE ACTIVITY                             | BEST RISK MANAGEMENT APPROACHES (BRMA) / BEST AVAILABLE TECHNIQUES (BAT)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | PROJECT DESIGN PROVISIONS AND COMPATIBILITY                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1. Handling of Drill Cuttings & Drilling Muds | <p>BRMAs include implementation of an integrated HSE Management System, environmental baseline surveys, EIA/ENVID assessments (covering discharge estimation, mud properties, chemical substitution, and risk evaluation), and specialist studies on well design and cuttings behaviour, with strong emphasis on minimising OBM use, avoiding discharges in sensitive areas, and monitoring cuttings where hydrocarbon-bearing zones may be encountered.</p> <p>BATs focus on practical waste and cuttings management options, including offshore reuse of drilling muds, offshore reinjection of cuttings where suitable disposal wells exist, controlled offshore discharge of non-hydrocarbon-bearing cuttings, and onshore treatment pathways such as thermal desorption, biological treatment, beneficial reuse, and disposal via landfill or incineration only as a last resort.</p> | <p>The Project uses water-based mud (WBM) across all well sections, with no NADF/OBM use.</p> <p>Riserless sections (conductor and 26" hole) involve seawater and viscous sweeps with seabed discharge, while deeper sections use a closed-loop circulation system with shale shakers and centrifuges to remove cuttings before discharge. Cuttings are discharged either at seabed or at ~12 m below sea level, depending on the well section. Quantities are assessed in Section 6.9.1.1, with conservative totals (~490 t seabed; ~453 t at 12 m).</p> <p>Drilling fluids are largely seawater-based (~96%) with biodegradable additives. No hydrocarbon-contaminated cuttings are discharged; such material is captured and shipped to shore.</p> <p>The approach is consistent with MARPOL and Barcelona Convention requirements.</p> |
| 2. Handling & Storage of Hydrocarbons         | <p>BRMAs include implementation of a comprehensive HSE Management System and documentation, application of inherently safe design principles supported by EIA/ENVID assessment, spill contingency planning, robust well control measures during drilling and completion (including blowout prevention and safe well testing), and systematic incident recording with corrective and preventive actions.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <p>No hydrocarbon production, testing, or flaring is planned (Section 6.10.1.1). Well operations are limited to exploration drilling.</p> <p>Well control is ensured with well barriers, including the hydrostatic pressure of the fluid and a secondary barrier with the BOP stack and associated well control equipment, and emergency procedures.</p> <p>Any potential hydrocarbon-contaminated cuttings (e.g. from unexpected zones or upsets) are not discharged and are contained and shipped to shore under controlled waste procedures (Section 6.9.1.1.2).</p> <p>Spill prevention and emergency response are covered through vessel response plans and SOPEP-type systems referenced across operational sections (Section 6.6.7).</p>                                                                                            |
| 3. Handling & Storage of Chemicals            | <p>BRMAs include implementation of an HSE Management System supported by full regulatory compliance with REACH and EU Biocides Regulation, application of the OSPAR HMCS (or equivalent) for chemical screening, risk assessment, and discharge control, and incorporation of inherently safe engineering</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <p>Chemicals are limited to drilling-related additives (e.g. viscosifiers, barite, potassium chloride, polymers, cement additives, pipe dope).</p> <p>The selection of chemicals follows recognised offshore classification approaches, including OSPAR HOCNF and the UK Offshore Chemical</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| OFFSHORE ACTIVITY                   | BEST RISK MANAGEMENT APPROACHES (BRMA) / BEST AVAILABLE TECHNIQUES (BAT)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | PROJECT DESIGN PROVISIONS AND COMPATIBILITY                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                     | design to minimise chemical release risks. They also include strict chemical transfer, storage, and operational controls (including bunding, closed systems, trained personnel, and monitored inventories), supported by spill contingency planning, routine inspection and maintenance, and systematic recording, reporting, and investigation of incidents to ensure risks are reduced to ALARP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Notification Scheme, or equivalent methodologies, to support the identification of low-hazard substances. All chemicals are selected under chemical management procedures with preference for low-toxicity and low bioaccumulation products (Section 6.7.1.1).<br>Storage of chemicals includes controlled handling, containment, and spill prevention measures (Section 6.7.1.2).<br>Pipe dope and chemical residues are managed as controlled hazardous waste streams and removed to shore (Sections 6.9.1.1.3 and 6.9.1.4).<br>Hazardous waste streams (oily sludge, solvents, contaminated materials) are segregated, stored onboard, and transferred to licensed facilities (Section 6.9.1.4).                                                                                                                                                                                                       |
| 4. Energy Efficiency                | BRMAs include early integration of energy efficiency into planning and environmental assessment processes, supported by the implementation of a comprehensive Energy Efficiency Management System covering the full project lifecycle, with defined policies, targets, monitoring, benchmarking, audits, and continuous improvement driven by senior management oversight. They also include energy-efficient engineering design and performance tracking to optimise consumption and equipment operation across the facility.<br>BATs focus on conducting energy efficiency studies during concept development to optimise design and equipment selection, implementing robust energy monitoring systems (including sensors and analytics) to identify inefficiencies, and improving utilities and auxiliary systems through measures such as heat recovery, cooling optimisation, and energy-efficient lighting (e.g., LED systems and use of natural light). | Energy use is indirectly optimised through short-duration drilling campaign design (67 days), logistics planning, and efficient vessel deployment.<br>Fuel use and emissions are quantified for MODU, support vessels, and helicopters (Sections 6.7.3 and 6.10.1.2), including use of compliant fuels under the Mediterranean Sea Sulphur Emission Control Area (0.10% sulphur limit).<br>A formal Energy Management System, performance KPIs, and BAT-driven energy optimisation programme should be established during Project implementation.                                                                                                                                                                                                                                                                                                                                                         |
| 6. Management of Fugitive Emissions | BRMAs include implementation of an HSE Management System, an Emissions Management Plan and a structured fugitive emissions inventory that identifies all emission sources, quantifies emissions using consistent methodologies, and integrates findings into environmental risk assessments and engineering design to minimise releases. They also include a formal LDAR programme with routine inspections, leak screening, equipment registers, and maintenance of records to ensure timely detection, repair, and reporting of fugitive emissions.<br>BATs focus on minimising leak potential through inherently low-emission design (e.g., reducing flanges, using welded piping, high-integrity seals, dry gas compressor seals, and zero-bleed controllers), combined with design for easy inspection access and fixed gas detection systems.<br>Operationally, BATs include routine LDAR using                                                           | Emissions arise solely from combustion sources: the MODU (IMO Tier I engines), support vessels, and helicopters. Fuel use complies with MARPOL Annex VI and Mediterranean Sea Sulphur Emission Control Area requirements, with low-sulphur marine fuel and Jet A-1 aviation fuel assumptions.<br>Emissions (NO <sub>x</sub> , SO <sub>x</sub> , CO, PM, CO <sub>2</sub> ) are quantified for a 67-day campaign (~331 t NO <sub>x</sub> total). Impacts are assessed, considering their short-term nature, as well as the offshore location (~44 km from shore) and dispersion conditions.<br>The design minimises potential fugitive releases through closed-loop mud circulation, solids control, BOP systems, well integrity barriers, and real-time LWD monitoring. No routine venting or flaring is planned, and methane emissions are limited to combustion-related sources only (Section 6.10.1.2). |

| 8. Drain Water Management    | <p>BRMAs include implementation of an HSE Management System supported by engineering design measures to minimise releases, with drainage-related discharges and risks addressed through environmental risk assessments (e.g. EIA/ENVID) and backed by spill contingency planning for drainage incidents.</p> <p>BATs focus on robust drain system design and operation, including segregation of open/closed and hazardous/non-hazardous drains, prevention of cross-contamination or overboard releases, adequate containment (bunds, drip trays, coamings), properly sized and accessible drain infrastructure, and provision for monitoring, sampling, and recovery of hydrocarbons where applicable. Operational BATs include controlled chemical inventories, prevention of inappropriate drain inputs during maintenance, routine inspection and maintenance via planned systems, personnel training, and use of diversion systems and spill response practices to ensure contaminants are captured and appropriately managed.</p> | <p>Offshore drainage will be managed through good housekeeping, containment, and waste segregation systems.</p> <p>In accordance with MARPOL Annex I, Greek implementing legislation and the Barcelona Convention Offshore Protocol, bilge and deck drainage discharges will be managed to prevent pollution through the application of approved treatment systems, operational controls, inspection and monitoring procedures (Section 6.8.1.1).</p> <p>Drilling discharges (fluids, cuttings, cement residues, and BOP hydraulic fluids) are controlled and discharged via defined subsea outlets at seabed or ~12 m depth under regulated conditions (Sections 6.9.1.1 &amp; 6.9.1.4).</p> <p>Hazardous and non-hazardous waste streams (including MSW, food waste, oils, sludge, chemicals) are segregated and stored onboard for transfer to shore (Section 6.9.1).</p> |
| 9. Facility Decommissioning  | <p>BRMAs include maintaining an HSE Management System across the full project lifecycle, comparative assessments of decommissioning options to identify the safest and most environmentally sound approach, and development of a regulator-approved Decommissioning Plan covering wells, facilities, and associated infrastructure. They also include integration of decommissioning into EIA/ENVID risk assessments, early consideration of end-of-life options in engineering design, and implementation of post-decommissioning monitoring and aftercare to confirm environmental performance and regulatory compliance.</p>                                                                                                                                                                                                                                                                                                                                                                                                          | <p>Decommissioning is fully integrated into the drilling programme (Section 6.14). After drilling, the well will be plugged and abandoned (P&amp;A) using cement barriers. The MODU will be demobilised, riser and BOP recovered, and seabed cleared of equipment via ROV survey. The wellhead will be left as a minimal-footprint structure. Onshore, the temporary logistics base will be fully demobilised with no permanent infrastructure.</p>                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 10. Environmental Monitoring | <p>BRMAs include implementation of an HSE Management System with a structured, risk-based Environmental Monitoring Programme, covering all project phases from baseline through operations to decommissioning, with monitoring scope defined according to installation type, environmental sensitivity, and potential impacts. They also include use of recognised standards (CEN/ISO), representative sampling and measurement methods, QA/QC procedures, and integration of monitoring requirements into engineering design to ensure robust data collection, interpretation, and reporting.</p> <p>BATs include incorporation of dedicated sampling ports and monitoring systems in</p>                                                                                                                                                                                                                                                                                                                                               | <p>Monitoring includes continuous drilling parameter monitoring (pressure, flow, LWD data), environmental baseline and seabed surveys, and post-operation ROV seabed clearance surveys (Section 6.6.6 &amp; 6.14.2.1).</p> <p>Air emissions are fully inventoried using IMO and EMEP/EEA methodologies, covering NO<sub>x</sub>, SO<sub>x</sub>, PM, CO and greenhouse gases (Section 6.10).</p> <p>Waste streams are quantified and tracked through onboard systems (e.g. Garbage Record Book, hazardous waste tracking).</p>                                                                                                                                                                                                                                                                                                                                               |

| OFFSHORE ACTIVITY | BEST RISK MANAGEMENT APPROACHES (BRMA) / BEST AVAILABLE TECHNIQUES (BAT)                                                                                                                                                                                                                                                                                                                                                                                                                                               | PROJECT DESIGN PROVISIONS AND COMPATIBILITY |

|                   | design (e.g. for combustion sources and drainage), use of standard emission factors updated with operational data, and installation of continuous or periodic monitoring equipment such as OIW analysers and flow meters. Operational BATs cover systematic monitoring of air emissions, fuel use, discharges, sediments, and water column conditions, alongside waste tracking and chemical composition analysis, supported by appropriate analytical methods, modelling, and environmental performance verification. |                                             |

## 5.5 Standards and Emission limits according to national & international legislation

### 5.5.1 Air quality standards

Air quality should be maintained in accordance with the provisions, limit values and guidelines set out in the following documents:

- JMD 14122/549/E103/24-03-2011 (GG B' 488), which establishes measures for improving air quality in compliance with Directive 2008/50/EC.
- JMD 22306/1075/E103/29-05-2007 (B' 920), which sets target values and assessment limits for concentrations of arsenic, cadmium, mercury, nickel, and polycyclic aromatic hydrocarbons in the air, in accordance with Directive 2004/107/EC.
- Ministerial Council Acts 25/18.3.88 (GG 52/A/22.3.88) and 34/30.5.02 (GG 125/A/5.6.02), "Limit and guideline values for air quality regarding sulfur dioxide, nitrogen dioxide and nitrogen oxides, particulate matter, and lead."
- PD 1180/81 (GG 293/A/1981) regarding point emissions of solids (suspended particles) from construction sites and project facilities sets a limit of 100 mg/m<sup>3</sup> (Article 2, paragraph d).

Table 5-14 presents limit values for the concentration of air pollutants according to JMD 14122/549/E103/2011 (GG 488/B/2011).

**Table 5-14: Limit values for concentrations of gaseous pollutants in the environment according to JMD 14122/549/E.103/2011**

|                                                                                    | 180<br>Alert threshold, hourly average value                                                    |                                 |                             |

### 5.5.2 Acoustic environment quality standards

For the assessment and management of **environmental noise**, the provisions of JMD 13586/724/28.3.2006 (GG B' 384) apply, as amended by Ministerial Decisions 13757/255/2022 (GG 710/B/16.2.2022) and 27136/1793/2018, (GG 6108/B/31.12.2018), which established measures, conditions, and methods for evaluating and managing noise in the environment in compliance with the provisions of Directive 2002/49/EC.

For the **noise emitted by construction equipment**, the provisions of JMD 37393/2028/29.3.2003 apply, which establish measures and conditions for noise emissions into the environment from equipment intended for outdoor use (GG B' 1418), as amended by JMD 9272/471/2.3.2007 (B' 286). For construction works, the limit for the Leq index at a distance of 100 meters from the boundaries of the construction site is Leq = 65 dB(A), based on the limits set by Presidential Decree 1180/81 (GG 293/A/06.10.1981) as the maximum permissible noise level from industrial and all types of mechanical installations. Additionally, the following apply regarding noise from construction activities:

- Presidential Decree 57/2010 (GG 97/A/25.6.2010) — Adaptation of Greek Legislation to Directive 2006/42/EC of the European Parliament and of the Council “on machinery and amending Directive 95/16/EC,” repealing PDs 18/96 and 377/93, as amended by PD 81/2011 (GG 197/A/9.9.2011) “Amendment of PD 57/2010 (97/A) in compliance with Directive 2009/127/EC of the European Parliament and of the Council ‘amending Directive 2006/42/EC.’”
- Ministerial Decision 56206/1613/1986 (GG 570B/9.9.1986) — “Specification of noise emission from machinery and construction site devices in compliance with Directives 79/113/EEC, 81/1051/EEC, 85/405/EEC.”
- Ministerial Decision 69001/1921/1988 (GG 751/B/18.10.1988) on the "EEC type approval for the limit noise level of machinery and construction site devices, specifically motor-driven air compressors, tower cranes, welding generator sets, power generator sets, and portable concrete breakers and pneumatic hammers," as amended by Ministerial Decision 10399Φ5.3/361/91 (GG 359B/28.5.1991) on the "Determination of the noise limit level for tower cranes as a supplement to Ministerial Decision 69001/1921/1988."
- Ministerial Decision 765/1991 (GG 81B/21.2.1991) on the "Determination of noise limit levels for hydraulic shovels, cable shovels of earth movers, loaders, and loader-excavators," as amended by Ministerial Decision 11481/523/97 (GG 295B/11.4.1997).

The maximum permissible limits of **environmental traffic noise** are defined in the JMD 211773/27.4.2012 (GG B' 1367) for the establishment of evaluation indicators and maximum permissible limits of environmental noise indicators originating from the operation of transportation projects.

Thus, the maximum permissible limits for traffic noise indicators are specified as follows:

- For the Lden indicator (24-hour): 70 dB(A),
- For the Lnight indicator (8-hour nighttime): 60 dB(A)

measured at a height of  $4.0 \pm 0.2$  m (3.8 to 4.2 m) above the ground and at a minimum distance of 2 m from the most exposed façade (towards the respective linear source of traffic noise) — either an external wall or window frame — of residential buildings and other sensitive uses requiring protection.

Lden is an indicator of the overall noise level during the day, evening, and night, used to quantify the annoyance associated with noise exposure. Lnight is an indicator of the noise level during the night. The values of the Lden and Lnight indicators are determined using a standardized common methodology set out in Annex II of the Directive, employing specific estimation methods as well as measurements.

### 5.5.3 Water and wastewater quality standards

The study area of the project falls within the Water District (WD) EL05 “Epirus”, for which River Basin Management Plans (RBMPs) have been prepared and approved, in accordance with the requirements of Directive 2000/60/EC, as implemented by Law 3199/2003 and Presidential Decree 51/2007.

The Water District of Epirus (EL05) consists of six (6) river basins: those of the Aoos (EL0511), the Kalamas (EL0512), the Acherontas (EL0513), the Arahthos (EL0514), the Kerkyras - Paxos (EL0534) and the Louros (EL0546).

More specifically, the onshore installations belong to the river basin of Kalamas (EL0512).

### 5.5.3.1.1 Water and Soil Quality Standards

#### 5.5.3.1.1.1 Surface waters

According to Measure **M05B0701** of the 1st Revision of the River Basin Management Plan (RBMP) of the Epirus Water District (WD) (GG 4664/B/2017), which remains unchanged in the 2nd Revision of the RBMP of the Epirus WD (GG 71/A/2024), to maintain and improve water quality, it is necessary to intensify inspections for water pollution originating from point-source discharges (urban, industrial, livestock waste, etc.).

This measure applies horizontally to all projects and activities that operate as point sources of discharges. Particular attention should be given to activities identified as exerting significant pressure per River Basin District (RBD) and per Regional Unit, and/or to those located within Drinking Water Protection Zone II under measures M05B0401 and M05B0403 of the same document.

The competent inspection authorities, in cooperation with the Water Directorates, shall establish an annual program of sampling inspections.

To facilitate the establishment of guidelines and the development of the necessary tools that will support the authorities responsible for environmental licensing in setting emission limits for the effective control of wastewater and industrial liquid waste discharges into surface water bodies, Measure M05B0702 was implemented.

Within the framework of implementing Measure M05B0702, specifications will be defined and the necessary tools will be developed (including a pilot application). These tools will make use of data from the “Management Tools,” the “Pollution Sources Registry,” and the analysis of point-source pressures for their further specialization at the River Basin District (RBD) level, with the aim of establishing emission limits for priority substances and other pollutants affecting surface waters, as set out in JMDs 51354/2641/E103/2010 and 170766/2016, as amended, as well as for other substances.

During this process, the following shall be considered:

- i. The Environmental Quality Standards established by JMDs 51354/2641/E103/2010 and 170766/2016.
- ii. The provisions of Directive 91/271/EEC.
- iii. The minimum river flow and the maximum discharges of liquid waste from various industrial and other activities (including Wastewater Treatment Plants – WWTPs).
- iv. The sensitivity character of the area.
- v. The daily and annual pollutant load generated by the activity.
- vi. The concentration of pollutants generated by the activity.
- vii. The relationship with protected areas concerning drinking water.

The Emission Limit Values shall constitute the maximum discharge limits per River Basin District (RBD), which in all cases must be complied with by the liquid waste effluents of industrial and other activities (including WWTPs) operating within the drainage basin.

#### 5.5.3.1.1.2 Groundwater

For groundwater, the established quality standards of Ministerial Decision 1811/2011 (GG 3322/B/2011) apply, which were adopted in implementation of paragraph 2 of Article 3 of JMD 39626/2208/E130/2009 (GG 2075/B/2009) (Table 5-15).

**Table 5-15: Quality standards of Ministerial Decision 1811/2011 for groundwater**

| PARAMETER                                                                              | QUALITY STANDARDS   |
|----------------------------------------------------------------------------------------|---------------------|
| Nitrates                                                                               | 50 mg/lit           |
| Active pesticide substances (including metabolites, degradation and reaction products) | 0,1 µg/lit          |
| Total pesticides*                                                                      | 0,5 µg/lit (total*) |
| pH                                                                                     | 6,5 - 9,5           |
| Conductivity                                                                           | 2.500 µScm          |
| Arsenic                                                                                | 10 µg/lit           |
| Cadmium                                                                                | 5 µg/lit            |
| Lead                                                                                   | 25 µg/lit           |
| Mercury                                                                                | 1 µg/lit            |
| Nickel                                                                                 | 20 µg/lit           |
| Total Chromium                                                                         | 50 µg/lit           |
| Aluminum                                                                               | 200 µg/lit          |
| Ammonium                                                                               | 0,5 mg/lit          |
| Nitrites                                                                               | 0,5 mg/lit          |
| Chloride ions                                                                          | 250 mg/lit          |
| Sulfate ions                                                                           | 250 mg/lit          |
| Sum of trichloroethylene and tetrachloroethylene                                       | 10 µg/lit           |

#### 5.5.3.1.1.3 Other Provisions

For the wider protection of surface water, groundwater, and soil from pollution arising from any type of runoff (e.g., suspended solids or sludge) and non-biodegradable substances (e.g., lubricants) generated during the construction works and the operation of construction-site facilities, the following legislation and requirements shall apply:

- Law 3199/2003 (GG A' 280), "Protection and Management of Waters – Harmonization with Directive 2000/60/EC of the European Parliament and of the Council", as amended and in force.
- Presidential Decree 51/2007 (GG A' 54), "Establishment of measures and procedures for the integrated protection and management of waters in compliance with Directive 2000/60/EC establishing a framework for Community action in the field of water policy".
- JMD 39626/2208/E130/25.09.2009 (GG B' 2075), concerning the establishment of measures for the protection of groundwater against pollution and deterioration.
- Presidential Decree 82/25.02.2004 (GG A' 64), "Management of Waste Lubricating Oils", with regard to the management procedures for used mineral oils.
- JMD 72751/3054/22.10.1985 (GG B' 665), "Toxic and Hazardous Waste and Elimination of

Polychlorinated Biphenyls and Polychlorinated Terphenyls in compliance with Directives 78/319/EEC and 76/403/EEC”, as amended and in force, with regard to the disposal and management of hazardous waste.

- Law 4042/2012 (GG A' 24), as amended and in force, the National Waste Management Plan (JMD 51373/4684/2015, GG B' 2706), and Law 2939/2001 (GG A' 179), as amended by Law 4496/2017 (GG A' 170), concerning source segregation, collection, transport, and management of solid waste, hazardous waste, recyclable and non-recyclable materials.
- The provisions of JMD 7589/731/29.03.2000 (GG B' 514) establishing measures and conditions for the management of polychlorinated biphenyls and polychlorinated terphenyls (PCB/PCT).
- Any specific requirements, restrictions, or provisions imposed and applicable within the Project area.

### 5.5.3.2 Wastewater Standards

#### 5.5.3.2.1 Wastewater Discharge Limit Standards

The wastewater discharge limit standards are defined in the Health Regulation E1β/221/65 concerning the "Disposal of liquid waste." Specifically, the quality standards and discharge limits for wastewater discharged into waters intended for swimming and any other use except for water consumption are as follows:

- pH 6,5 - 8,5.
- Dissolved oxygen 5 mg/l.
- Coliform bacteria 0 – 50 / 100ml.
- Absence of settling solids or sludge deposits originating from liquid or industrial waste
- Non-toxic, non-harmful, or non-thermal wastewater

Additionally, wastewater must be effectively treated before its discharge into the final recipient. The city of Igoumenitsa is served by the Igoumenitsa Wastewater Treatment Plant (WWTP - EL212001012), which forms part of the urban wastewater management infrastructure of the Region of Epirus.

The compliance requirements for the treated effluent discharged from the Igoumenitsa Wastewater Treatment Plant are defined in accordance with the Urban Wastewater Treatment Directive 91/271/EEC, as transposed into Greek legislation by Joint Ministerial Decision 5673/400/1997. These requirements relate to the applicable effluent quality limits, the minimum annual number of samples to be collected according to the design capacity of the WWTP, and the maximum number of samples that may deviate from the required effluent standards.

**Table 5-16: Required effluent limits according to Directive 91/271/EEC**

| PARAMETER                                        | LIMIT / REQUIREMENT                                                                      |
|--------------------------------------------------|------------------------------------------------------------------------------------------|
| BOD <sub>5</sub> at 20 °C, without nitrification | 25 mg/l or 70–90% reduction                                                              |
| COD                                              | 125 mg/l or 75% reduction                                                                |
| Suspended solids (SS)                            | 35 mg/l for agglomerations >10,000 p.e.;<br>60 mg/l for agglomerations 2,000–10,000 p.e. |

|                                            |                                                                                    |
|--------------------------------------------|------------------------------------------------------------------------------------|
| TP, where sensitive receiving waters apply | 2 mg/l for 10,000–100,000 p.e.;<br>1 mg/l for >100,000 p.e.; or 80% reduction      |
| TN, where sensitive receiving waters apply | 15 mg/l for 10,000–100,000 p.e.;<br>10 mg/l for >100,000 p.e.; or 70–80% reduction |

#### 5.5.3.2.2 Sewage from ships, International Convention for the Prevention of Pollution from Ships, MARPOL 73/78, Annex I, IV, V

##### Annex I: Regulations for the Prevention of Pollution by Oil (Entered into force on October 2, 1983)

It covers the prevention of pollution from oil through operational measures, as well as accidental discharges. The 1992 amendments to Annex I made double hulls mandatory for new oil tankers and set a phased timetable for the adaptation of double hulls on existing tankers, which was later revised in 2001 and 2003.

##### Annex IV: Prevention of Pollution from Ship Sewage (entered into force on September 27, 2003)

It includes requirements for controlling marine pollution from sewage. Discharge of sewage into the sea is prohibited unless the ship is equipped with and operating an approved sewage treatment plant, or if the ship discharges comminuted and disinfected sewage using an approved system at a distance greater than three nautical miles from the nearest shore. Sewage that is neither comminuted nor disinfected must be discharged at more than 12 nautical miles from the nearest shore.

##### Annex V: Prevention of Pollution by Garbage from Ships (entered into force on December 31, 1998)

It includes various types of garbage and specifies the distances from the shore and the way they can be disposed of. The most important feature of the Annex is the complete prohibition it imposes on the discharge of any form of plastic into the sea.

#### 5.5.4 Standards and limit values according to international legislation for offshore discharges and emissions (Asopus – 1 exploration well)

##### 5.5.4.1 Quality Standards for discharges related to the drilling process

##### 5.5.4.1.1 Quality standards for drilling fluids and cuttings discharges

Greece, as a Contracting Party to the Barcelona Convention and its Offshore Protocol, implements the UNEP/Mediterranean Action Plan (MAP) Common Standards and Guidelines (2022)<sup>26</sup> for the use and disposal of drilling fluids and cuttings in the Mediterranean. These standards require the establishment of a project-related Chemical Use Plan. As mentioned within the guidance document:

“A Chemical Use Plan shall be prepared for the use of all drilling fluids by the Operator in line with the Environmental Impact Assessment (EIA) for all offshore activities. The Chemical Use Plan must quantify and

<sup>26</sup> Decision IG.24/9 – Mediterranean Offshore Guidelines and Standards: (a) Common Standards and Guidance on the Disposal of Oil and Oily Mixtures and the Use and Disposal of Drilling Fluids and Cuttings; (b) Common Standards and Guidelines for Special Restrictions or Conditions for Specially Protected Areas (SPA) within the Framework of the Mediterranean Offshore Action Plan

assess the environmental risk of each chemical additive that may potentially be used during the drilling, cementing and completion of the well. Subsequent well operations, including well intervention, workover, suspension and abandonment operations will be subject to similar requirements”.

Selecting water-based drilling fluids (WBM) and additives that are low in toxicity, have limited bioaccumulation, and are highly biodegradable is strongly favorable against Non-Aqueous Based Fluids (NADF) and most commonly used. As also highlighted within the guidance:

” Under specific circumstances, used WBM and associated drill cuttings may be disposed of by discharging into the sea. A permit from the Competent Authority must be obtained for the usage and discharge of WBM offshore and WBM cuttings”

When drilling through reservoir sections of the well, cuttings originating from the pay zone (hydrocarbon-bearing formation), together with the associated drilling fluids returned to the surface, may contain small quantities of reservoir hydrocarbons such as crude oil or condensate. Any cuttings and/or water-based muds (WBM) contaminated by reservoir fluids should be either 1.) collected, contained, and transported to shore for appropriate treatment and disposal 2.) be re-injected into a suitable geological formation where feasible or 3.) subject to approval by the Competent Authority, treated to achieve the applicable environmental performance standards prior to discharge to the marine environment with authorized discharges strictly monitored and reported to the Competent Authority.

The use of non-aqueous drilling fluids is strictly controlled, and their discharge is prohibited. Discharges of drilling fluids and cuttings to the sea must be minimised and managed through proper planning, fluid design, and operational practices.

The discharge of WBM and cuttings to the seabed during shallow hole sections is accepted industry practice for deepwater exploration and is consistent with Greece’s obligations under the Barcelona Convention Offshore Protocol and the UNEP/MAP Common Standards and Guidelines, which permit the discharge of water-based mud and cuttings subject to chemical selection and discharge minimisation requirements.

#### 5.5.4.1.2 Quality Standards for cementing discharges

Cement is used to seal the casing-formation annulus after each hole section is drilled, providing long-term zonal isolation and well integrity. The cement slurry is primarily composed of cement powder, water and selected cement additives (e.g. retarders, accelerators, fluid-loss additives) are screened in accordance with UNEP/MAP offshore chemical requirements and the operator’s Chemical Use Plan, with preference given to additives of low environmental risk.

#### 5.5.4.1.3 Quality standards for BOP discharges

The subsea blowout preventer (BOP) stack is installed as a primary well-control barrier and is routinely operated and tested during drilling, including opening and closing of annular and ram preventers as part of planned function and pressure tests. During these operations, and during any required lower marine riser package (LMRP) disconnects, a proportion of the water-based hydraulic control fluid is vented to sea at the seabed, while the remainder is recovered via the BOP control fluid return system. Based on manufacturer information and offshore chemical screening, this water-soluble fluid blend should be classified as readily

biodegradable under recognised OECD test methods and formulated to have low toxicity and limited potential for bioaccumulation.

#### 5.5.4.1.4 Quality standards for operational discharges

The International Convention for the Prevention of Pollution from Ships (MARPOL) is the main international convention covering prevention of pollution of the marine environment by ships from operational or accidental causes.

The MARPOL Convention was adopted on 2 November 1973 at the International Maritime Organisation (IMO).

Drilling operations comprising the drilling unit and support vessels must comply with the International Convention for the Prevention of Pollution from Ships (MARPOL) as implemented in Greek law, including Annexes I (oil), IV (sewage), V (garbage), and any other applicable annexes. Compliance includes using approved pollution prevention equipment, maintaining valid international or national certificates, and monitoring and recording relevant discharges, such as treated bilge water, treated sewage, and authorised garbage discharges, within applicable limits and operational conditions.

#### 5.5.4.1.5 Quality standards for mixtures containing hydrocarbons (oil & oily mixtures)

Annex I - Regulations for the Prevention of Pollution by Oil (entered into force 2 October 1983), covers prevention of pollution by oil from operational measures as well as from accidental discharges. Under International Maritime Organization MARPOL Annex I, Regulation 15, governs the control of discharge of oil from machinery spaces of ships and sets the operational requirements for oily water separation, discharge monitoring, and record keeping. The regulation aims to prevent marine pollution by restricting the discharge of oily mixtures from machinery spaces into the sea unless strict conditions are met.

For ships of 400 gross tonnage and above, oily mixtures from machinery spaces may only be discharged overboard when all of the following conditions are satisfied:

- The ship is proceeding “en route”.
- The oily mixture has been processed through approved oily water filtering equipment.
- The oil content of the effluent does not exceed 15 parts per million (15 ppm).
- The equipment is fitted with:
  - an oil content meter,
  - alarm arrangements, and
  - automatic stopping arrangements preventing discharge above 15 ppm.
- The oily mixture does not originate from cargo pump-room bilges on oil tankers (special tanker rules apply).

For oil tankers, additional restrictions apply depending on ship type and ballast arrangements.

Ships subject to the regulation must carry IMO-approved certificates and MEPC.107(49)<sup>27</sup> compliant:

- Oily Water Separator (OWS),
- 15-ppm bilge alarm,
- automatic stopping device.

MARPOL Annex I Regulation 17 sets out the requirements for maintaining an Oil Record Book (ORB) to document oil-related operations onboard ships.

The ORB is one of the most important statutory pollution-prevention documents carried on board and is closely inspected during flag-state and port-state control examinations.

The purpose of the oil record book is to provide an official record of transfers and discharges of oil and oily mixtures and to allow the authorities to verify compliance with MARPOL discharge regulations.

#### 5.5.4.1.6 Sewage

Annex IV – Regulations for the prevention of pollution by sewage from ships, contains a set of regulations regarding the discharge of sewage into the sea from ships, including regulations regarding the ships' equipment and systems for the control of sewage discharge, the provision of port reception facilities for sewage, and requirements for survey and certification.

It is generally considered that on the high seas, the oceans are capable of assimilating and dealing with raw sewage through natural bacterial action. Therefore, the regulations in Annex IV of MARPOL prohibit the discharge of sewage into the sea within a specified distance from the nearest land, unless otherwise provided.

Governments are required to ensure the provision of adequate reception facilities at ports and terminals for the reception of sewage, without causing delay to ships.

The revised Annex applies to ships, engaged in international voyages, of 400 gross tonnage and above or which are certified to carry more than 15 persons. The Annex requires ships to be equipped with either an approved sewage treatment plant subject to the provisions of MEPC.227(64)<sup>28</sup>, or an approved sewage comminuting and disinfecting system or a sewage holding tank.

Under regulations 9.1.1 and 9.2.1 of MARPOL Annex IV, sewage treatment plants on board ships need to comply with specific design, installation, performance and testing criteria and;

*"should meet the following effluent standards when tested for its Certificate of Type Approval by the Administration:*

1. Thermotolerant Coliform Standard

---

<sup>27</sup> MEPC.107(49) – Revised guidelines/specifications for pollution prevention equipment for machinery space bilges of ships

<sup>28</sup> MEPC.227(64) – Guidelines on implementation of effluent standards and performance tests for sewage treatment plants

*The geometric mean of the thermotolerant coliform count of the samples of effluent taken during the test period should not exceed 100 thermotolerant coliforms/100 ml as determined by membrane filter, multiple tube fermentation or an equivalent analytical procedure.*

## 2. Total Suspended Solids (TSS) Standard

- The geometric mean of the total suspended solids content of the samples of effluent taken during the test period should not exceed 35 Qi/Qe mg/l.
- Where the sewage treatment plant is tested on board ship, the maximum total suspended solids content of the samples of effluent taken during the test period may be adjusted to take account of the total suspended solid content of the flushing water. In allowing this adjustment in maximum TSS, Administrations should ensure sufficient tests of TSS are taken of the flushing water throughout the testing period to establish an accurate geometric mean to be used as the adjustment figure (defined as x). In no cases should the maximum allowed TSS be greater than (35 plus x) Qi/Qe mg/l.

*Method of testing should be by:*

- filtration of representative sample through a 0.45 µm filter membrane, drying at 105°C and weighing, or
- centrifuging of a representative sample (for at least five minutes with mean acceleration of 2,800-3,200 g), drying at least 105°C and weighing, or
- other internationally accepted equivalent test standard.

## 3. Biochemical oxygen demand (BOD) without nitrification and chemical oxygen demand.

*Administrations should ensure the sewage treatment plant is designed to reduce both soluble and insoluble organic substances to meet the requirement that, the geometric mean of 5-day biochemical oxygen demand without nitrification (BOD5 without nitrification) of the samples of effluent taken during the test period does not exceed 25 Qi/Qe mg/l and the chemical oxygen demand (COD) does not exceed 125 Qi/Qe mg/l. The test method standard should be ISO 5815 1:2003 for BOD5 without nitrification and ISO 15705:2002 for COD, or other internationally accepted equivalent test standards.*

## 4. pH

*The pH of the samples of effluent taken during the test period should be between 6 and 8.5.*

## 5. Zero or non-detected values

*For thermotolerant coliforms zero values should be replaced with a value of 1 thermotolerant coliform/100 ml to allow the calculation of the geometric mean. For total suspended solids, biochemical oxygen demand without nitrification and chemical oxygen demand values below the limit of detection should be replaced with one half the limit of detection to allow the calculation of the geometric mean”.*

The International Sewage Pollution Prevention Certificate (ISPP Certificate) is a statutory certificate issued under the provisions of Annex VI – Regulations for the prevention of Pollution by Sewage from Ships and confirms that a ship complies with international requirements for sewage collection, treatment, and discharge.

The certificate verifies that the ship has approved arrangements for sewage management, such as:

- an approved sewage treatment plant (STP),
- a sewage comminuting and disinfecting system,
- a sewage holding tank.

It also ensures the vessel complies with MARPOL Annex IV discharge standards.

Sewage which is not comminuted or disinfected may be discharged at a distance of more than 12 nautical miles from the nearest land when the ship is proceeding at not less than 4 knots, and the rate of discharge of untreated sewage shall be in compliance with MEPC.157(55)<sup>29</sup>.

#### 5.5.4.1.7 Garbage

Annex V Prevention of Pollution by Garbage from Ships deals with different types of garbage and specifies the distances from land and the manner in which they may be disposed of. The most important feature of the Annex is the complete ban imposed on disposing into the sea of all forms of plastics.

The 2017 Guidelines for the Implementation of MARPOL Annex V are included within Resolution MEPC.295(71)<sup>30</sup> and provide practical guidance for implementing the provisions of Annex V – Prevention of Pollution by Garbage from Ships.

*Under the revised MARPOL Annex V, “discharge of all garbage into the sea is prohibited, except as specifically permitted in regulations 3, 4, 5 and 6 of the Annex. Annex V reverses the historical presumption that garbage may be discharged into the sea based on the nature of the garbage and defined distances from shore. Regulation 7 provides limited exceptions to these regulations in emergency and non-routine situations. Generally, discharge is restricted to food wastes, identified cargo residues, animal carcasses, identified cleaning agents and additives, and cargo residues entrained in washwater which are not harmful to the marine environment. It is recommended that ships use port reception facilities as the primary means of discharge for all garbage”*

“Garbage” is clearly defined in section 1.7 of the Guidelines and presents a clear indication of what should or should not be accounted as garbage under MARPOL Annex V.

The guidelines establish strict discharge conditions for food waste based on distance from land, whether the waste is comminuted, and whether the ship operates inside a MARPOL Special Area such as the Mediterranean Sea, where most garbage discharges are prohibited. The resolution also details requirements for Garbage Management Plans on ships of 100 GT and above or ships carrying 15 persons or more, requiring procedures for garbage collection, segregation, storage, processing, and disposal. In addition, ships of 400 GT and above or ships carrying 15 persons or more on international voyages must maintain a Garbage Record Book documenting all garbage discharges, shore disposals, incineration, and accidental losses. Ships of 12 meters or more in length must display garbage placards informing crew and passengers of disposal restrictions. MEPC.295(71) further emphasizes the importance of adequate port reception facilities and crew training to reduce marine litter and improve compliance. During Port State Control inspections,

<sup>29</sup> MEPC.157(55) – Recommendation of standards for the rate of discharge of untreated sewage from ships

<sup>30</sup> MEPC.295(71) – 2017 Guidelines for the implementation of MARPOL Annex V

authorities commonly verify Garbage Record Books, garbage segregation practices, storage arrangements, placards, and receipts from shore reception facilities to ensure compliance with Annex V regulations.

Ultimately, according to section 2.3.1 *“Regulation 3 of MARPOL Annex V provides that the discharge of garbage into the sea is prohibited, with limited exceptions, as summarized in table 1. Under certain conditions discharge into the sea of food wastes, animal carcasses, cleaning agents and additives contained in hold washwater, deck and external surface washwater and cargo residues which are not considered to be harmful to the marine environment is permitted”*. Table 5-17 below, presents the discharge exceptions as mentioned in MARPOL Annex V.

**Table 5-17: Summary of restrictions to the discharge of garbage into the sea under regulations 4, 5, 6 and 14 of MARPOL Annex V and chapter 5 of part II-A of the Polar Code.**

| GARBAGE TYPE <sup>1</sup>                                                                                                                                                                                                                            | ALL SHIPS EXCEPT PLATFORMS                                                                               |                                                                                                                                              | OFFSHORE PLATFORMS LOCATED MORE THAN 12 NM FROM NEAREST LAND AND SHIPS WHEN ALONGSIDE OR WITHIN 500 M OF SUCH PLATFORMS <sup>4</sup> REGULATION 5 |

| Food waste comminuted or ground <sup>2</sup>                                                                                                                                                                                                         | >3 nm, en route and as far as practicable                                                                | >12 nm, en route and as far as practicable <sup>3</sup>                                                                                      | Discharge permitted                                                                                                                               |
| Food waste not comminuted or ground                                                                                                                                                                                                                  | >12 nm, en route and as far as practicable                                                               | Discharge prohibited                                                                                                                         | Discharge prohibited                                                                                                                              |
| Cargo residues <sup>5,6</sup> not contained in washwater                                                                                                                                                                                             | > 12 nm, en route and as far as practicable                                                              | Discharge prohibited                                                                                                                         | Discharge prohibited                                                                                                                              |
| Cargo residues <sup>5,6</sup> contained in washwater                                                                                                                                                                                                 |                                                                                                          | > 12 nm, en route and as far as practicable (subject to conditions in regulation 6.1.2 and paragraph 5.2.1.5 of part II-A of the Polar Code) |                                                                                                                                                   |
| Cleaning agents and additives <sup>6</sup> contained in cargo hold washwater                                                                                                                                                                         | Discharge permitted                                                                                      | > 12 nm, en route and as far as practicable (subject to conditions in regulation 6.1.2 and paragraph 5.2.1.5 of part II-A of the Polar Code) | Discharge prohibited                                                                                                                              |
| Cleaning agents and additives <sup>6</sup> in deck and external surfaces washwater                                                                                                                                                                   |                                                                                                          | Discharge permitted                                                                                                                          |                                                                                                                                                   |
| Animal Carcasses (should be split or otherwise treated to ensure the carcasses will sink immediately)                                                                                                                                                | Must be en route and as far from the nearest land as possible. Should be >100 nm and maximum water depth | Discharge prohibited                                                                                                                         | Discharge prohibited                                                                                                                              |
| All other garbage including plastics, synthetic ropes, fishing gear, plastic garbage bags, incinerator ashes, clinkers, cooking oil, floating dunnage, lining and packing materials, paper, rags, glass, metal, bottles, crockery and similar refuse | Discharge prohibited                                                                                     | Discharge prohibited                                                                                                                         | Discharge prohibited                                                                                                                              |

- 1 When garbage is mixed with or contaminated by other harmful substances prohibited from discharge or having different discharge requirements, the more stringent requirements shall apply.
- 2 Comminuted or ground food wastes must be able to pass through a screen with mesh no larger than 25 mm
- 3 The discharge of introduced avian products in the Antarctic area is not permitted unless incinerated, autoclaved or otherwise treated to be made sterile. In polar waters, discharge shall be made as far as practicable from areas of ice concentration exceeding 1/10 in any case food wastes shall not be discharged onto the ice.
- 4 Offshore platforms located 12 nm from nearest land and associated ships include all fixed or floating platforms engaged in exploration or exploitation or associated processing of seabed mineral resources, and all ships alongside or within 500 m of such platforms.
- 5 Cargo residues mean only those that cannot be recovered using commonly available methods for unloading.
- 6 These substances not to be harmful to the marine environment.

#### 5.5.4.1.8 Ballast water

The International Convention for the Control and Management of Ships' Ballast Water and Sediments (BWM Convention) is an international treaty adopted by the IMO in 2004 and entered into force in 2017 to prevent the spread of harmful aquatic organisms and pathogens through ships' ballast water and sediments. Ships use ballast water for stability and safe operation, but when ballast water taken in one region is discharged in another, invasive species can be introduced into foreign marine ecosystems, causing environmental, economic, and public health damage. The Convention requires ships to manage ballast water through approved procedures and treatment systems, maintain a ship-specific approved Ballast Water Management Plan (BWMP) under standard B-1, and keep a Ballast Water Record Book under standard B-2, documenting ballast operations. The Convention establishes two principal standards:

Under D-1 Ballast Water Exchange Standard, ships conducting ballast water exchange must achieve at least 95% volumetric exchange of ballast water to reduce the transfer of harmful aquatic organisms and invasive species. Ballast water exchange should normally be carried out at least 200 nautical miles from the nearest land and in water at least 200 meters deep. If this is not possible, the exchange should be conducted at least 50 nautical miles from the nearest land and in water at least 200 meters deep. Accepted exchange methods include the sequential, flow-through, and dilution methods, provided the operation does not compromise the safety or stability of the ship.

Standard D-2 Ballast Water Performance Standard limits the number of viable organisms discharged by requiring approved Ballast Water Management Systems (BWMS) such as filtration, UV treatment, or electrochlorination systems.

Under Regulation D-3, all ballast water treatment systems must be type-approved according to IMO guidelines and performance testing standards as described within MEPC.300(72)<sup>31</sup>. Ships are also subject to surveys, certification, and Port State Control inspections to verify compliance with ballast water management requirements. The Convention is considered one of the most important international measures for protecting marine biodiversity from invasive aquatic species transferred by global shipping.

---

<sup>31</sup> MEPC.300(72) – Code for approval of ballast water management systems (BWMS Code)

#### 5.5.4.1.9 Quality standards for operational emissions

MARPOL Annex VI – Regulations for the Prevention of Air Pollution from Ships, sets limits on sulphur oxide and nitrogen oxide emissions from ship exhausts and prohibits deliberate emissions of ozone depleting substances.

Resolution MEPC.176(58)<sup>32</sup> adopted the revised MARPOL Annex VI. The resolution establishes the international regulatory framework for the prevention of air pollution from ships. The resolution sets limits on emissions of sulphur oxides (SO<sub>x</sub>), nitrogen oxides (NO<sub>x</sub>), particulate matter, and ozone-depleting substances, and establishes requirements for fuel oil quality and the designation of Emission Control Areas (ECAs).

Key emission limits include:

- Fuel oil sulphur content limit between 1.50% m/m and 0.10% m/m within designated SO<sub>x</sub> Emission Control Areas and subject to ship construction date
- NO<sub>x</sub> emission standards for marine diesel engines above 130 kW, implemented through Tier I, Tier II, and Tier III limits subject to engine installation date and operating area (Regulation 13).
- Restrictions on emissions of ozone-depleting substances and controls on shipboard incineration.

Compliance may be achieved using compliant low-sulphur fuels, alternative fuels, approved exhaust gas cleaning systems (scrubbers), NO<sub>x</sub> reduction technologies such as Selective Catalytic Reduction (SCR) or Exhaust Gas Recirculation (EGR), and adherence to fuel quality, monitoring, and record-keeping requirements.

Resolution MEPC.177(58)<sup>33</sup> adopted the NO<sub>x</sub> Technical Code 2008, which provides the technical requirements for demonstrating compliance with the NO<sub>x</sub> emission limits established under MARPOL Annex VI Regulation 13.

The Code applies to marine diesel engines with a power output exceeding 130 kW and establishes:

- Procedures for Engine emission testing and certification.
- Requirements for Engine International Air Pollution Prevention (EIAPP) certification.
- Preparation and maintenance of Engine Technical Files.
- Onboard verification, inspection, and survey procedures.
- Methods for monitoring modifications that may affect NO<sub>x</sub> emissions.

Compliance is demonstrated through pre-certification testing, issuance and maintenance of EIAPP certification, periodic surveys, engine parameter checks, simplified measurement methods, or direct exhaust emission measurements. The Code ensures that certified engines continue to meet the applicable Tier I, Tier II, or Tier III NO<sub>x</sub> emission limits throughout their operational life.

<sup>32</sup> MEPC.176(58) - AMENDMENTS TO THE ANNEX OF THE PROTOCOL OF 1997 TO AMEND THE INTERNATIONAL CONVENTION FOR THE PREVENTION OF POLLUTION FROM SHIPS, 1973, AS MODIFIED BY THE PROTOCOL OF 1978 RELATING THERETO

<sup>33</sup>MEPC.177(58) - AMENDMENTS TO THE TECHNICAL CODE ON CONTROL OF EMISSION OF NITROGEN OXIDES FROM MARINE DIESEL ENGINES

## 5.6 Location of the project in relation to the areas of the natural and anthropogenic environment of the region

### 5.6.1 Established boundaries of settlements and approved urban plans

The Port of Igoumenitsa occupies a strategic position along Greece's western seaboard and constitutes one of the country's principal international maritime gateways, providing passenger and freight connections with Italy and the Ionian Islands. As the western terminus of the Egnatia Motorway and a core node of the Trans-European Transport Network (TEN-T), the port serves as a major transport and logistics hub of national and international significance. It is a legally established national port infrastructure facility whose institutional development has been implemented through a series of legislative and administrative acts. The port was initially established as the principal port of the Prefecture of Thesprotia and subsequently operated through the Igoumenitsa Port Fund. Pursuant to *Law 2932/2001 (GG A' 145/2001)*, the Port Fund was transformed into Igoumenitsa Port Authority SA (OLIG SA), which became responsible for the administration, operation, maintenance and development of the port. Through the Concession Agreement signed between the Hellenic Republic and the Port Authority in 2002, the Greek State granted the Authority the right to use, manage and develop the port land zone and associated infrastructure. The current legal and operational framework of the Port of Igoumenitsa is governed by the amended concession agreement ratified by *Law 5048/2023*. Accordingly, the proposed onshore supply base is located within an existing, legally approved and operational port area designated for transport, logistics and port-related activities as described in detail in Chapter 8.

The proposed onshore supply base will be located within the operational area of the Port of Igoumenitsa and the use of existing port facilities for temporary logistics, storage, vessel support, and personnel transfer activities will be consistent with the transport and logistics functions of the port area and will not require modifications to existing boundaries.

The area of the Port of Igoumenitsa is covered by the General Urban Plan (GUP) of the Municipal Unit of Igoumenitsa, which constitutes the principal statutory urban-planning instrument governing land-use allocation, urban development, infrastructure planning, and environmental protection within the municipal area.

The General Urban Plan (GUP) of Igoumenitsa was approved by *Decision 73578/4964/17.12.2010 (GG 575/AAP/31.12.2010)*. Under the approved GUP, the area under consideration has been designated as Port Zone B4.5, within which no land uses or activities other than port-related activities are envisaged, as illustrated in Figure 5-15 below.

Figure 5-15: Urban Planning Organization Map of the Igoumenitsa City Complex. Extract from the approved General Urban Plan (GUP) of the former Municipality of Igoumenitsa (Source: Decentralized Administration of Epirus and Western Macedonia portal<sup>34</sup>, accessed June 2026)

The existing and proposed Port Zone boundaries are maintained in accordance with the Igoumenitsa Port Master Plan and the decisions of the Port Planning and Development Committee (ESAL), namely *Decision 02/10.12.2002* of the 4th ESAL Session and *Decision 02/17.12.2004* of the 15<sup>th</sup> ESAL Session.

<sup>34</sup> [Μελέτες Γ.Π.Σ. - Σ.Χ.Ο.Ο.Α.Π. - Αποκεντρωμένη Διοίκηση Ηπείρου - Δυτικής Μακεδονίας | www.apdhp-dm.gov.gr](http://www.apdhp-dm.gov.gr)

The determination of land uses within the Port Zone does not fall within the scope of the General Urban Plan but is the responsibility of the Port Planning and Development Committee (ESAL), pursuant to Article 19 of Law 2932/2001 (GG 145/A/2001) and Law 2971/2001 (GG 285/A/2001).

Permitted uses within the Port Zone include port facilities, infrastructure, and associated developments in accordance with the approved Port Development Master Plan and any subsequent relevant planning or technical studies.

The approved General Urban Plan (GUP) in question superseded the previously approved “General Urban Plan of Igoumenitsa–Graikochori and parts of Ladochori and Nea Selefkeia” (GG 610/D/3 October 1989), as amended by the relevant decision published in GG 1073/D/1992.

The most recently approved General Urban Plan (GUP) of Igoumenitsa applies to the administrative area of the former Municipality of Igoumenitsa, which currently constitutes the Municipal Unit of Igoumenitsa within the Municipality of Igoumenitsa. The planning area includes the urban settlement of Igoumenitsa and the communities of Graikochori, Nea Selefkeia, Ladochori, Agia Marina, Agios Vlasios, Kastri, Kryovrysi and Mavroudi. The Port of Igoumenitsa and the proposed onshore supply base are located within this planning area and are therefore subject to the provisions and land-use designations established by the approved General Urban Plan.

The nearest urban and settlement planning instruments (Figure 5-16) include the settlement planning frameworks of the Municipal Units of Plataria, Syvota, Perdika and Margariti. However, these latter plans do not overlap with the project area.

In addition, the Municipality of Igoumenitsa is included in the ongoing Special Urban Planning Scheme (SUPS) for the Coastal Front of the Region of Epirus, which is intended to provide updated spatial planning guidance for coastal municipalities. Nevertheless, the proposed project relies exclusively on existing port infrastructure and does not involve the construction of new permanent facilities or the expansion of urban development areas.

Figure 5-16: Spatial and Residential Organization Plans (ΣΧΟΟΑΠ) of Syvota, Margariti, Sagiada & Perdika numbered 24, 25, 26 and 27 respectively (Source: Epirus Region Planning Portal<sup>35</sup>, accessed June 2026).

## 5.6.2 Boundaries of areas of the National System of Protected Areas according to Law 3937/2011

The designated areas of the European Ecological Network Natura 2000, as redefined by JMD 50743 (GG 4432/B/15-12-2017), are not located within areas encompassed by the project under examination.

Regarding the offshore project components, the nearest Natura 2000 sites to Exploration Well Asopus 1 are GR2230010 “Marine Area of the Diapontia Islands” and GR2230008 “Diapontia Islands: Othoni, Ereikousa, Mathraki and rocky islets”, both located approximately 41 km from the well location.

Regarding the Igoumenitsa shore base facilities, the nearest Natura 2000 sites are GR2120001 “Ekvoles (Delta) Kalama” and GR2120005 “Ygrotopos Ekvolon Kalama kai Nisos Prasoudi”, both located approximately 3.5 km from the facilities. Although these protected areas are in the wider area, the project footprint does not fall within their boundaries.

At approximately 7,500 m to the northeast lies the designated Natura 2000 site GR2120007 “STENA PARAKALAMOU”, while approximately 5,400 m to the southwest lies the designated Natura 2000 site

<sup>35</sup> [Περιφέρεια Ηπείρου - Region of Epirus](#)

GR2230004 “NISOI PAXOI KAI ANTIPAXOI KAI EVRYTERI THALASSIA PERIOCHI”. Owing to their distance from the project, these areas cannot be affected by the proposed development.

As shown in Figure 5-17, no part of the project falls within any protected area of the Natura 2000 network.

Figure 5-17: Protected Natura 2000 Network Areas in the wider project area

**Table 5-18: Distances from protected areas of Natura 2000 network**

| SITE CODE                                  | SITENAME                                                        | DESIGNATION | DISTANCE |
|--------------------------------------------|-----------------------------------------------------------------|-------------|----------|
| <b>From Exploration Well Asopus 1</b>      |                                                                 |             |          |
| GR2230010                                  | Marine Area of the Diapontia Islands                            | SAC         | ≈ 41 km  |
| GR2230008                                  | Diapontia Islands: Othoni, Ereikousa, Mathraki and rocky islets | SPA         | ≈ 41 km  |
| <b>From Igoumenitsa Onshore Facilities</b> |                                                                 |             |          |
| GR2120001                                  | Ekvoles (Delta) Kalama                                          | SCI         | ≈ 3.5 km |
| GR2120005                                  | Ygrotopos Ekvolon Kalama kai Nisos Prasoudi                     | SPA         | ≈ 3.5 km |
| GR2230004                                  | Nisi Paxi & Antipaxi kai euriteri thalassia periochi            | SCI / SAC   | ≈ 5.4 km |
| GR2120007                                  | Stena Parakalamou                                               | SPA         | ≈ 7.5 km |

All other protected natural areas are located more than 2 km from the project site. These include:

- the Kalamas River Biotope (AB3090039), approximately 3,950 m to the north;
- the CORINE site A00010031 “Kalamas (Thyamis) Estuary”, approximately 3,000 m to the northwest; and
- the Important Fish Habitat (TIFK) AT3011004 “Kalamas Estuary”, approximately 5,200 m to the northwest.

Similarly, because they are distant from the project, these protected areas cannot be affected by the proposed development.

Near the project site, there are also Wildlife Refuges, namely:

- “Vatatsa – Divari – Valtos Bay – Drepano, Municipality of Igoumenitsa” (Code K906, GG 951/B/10-07-2003, amendment), located approximately 1,860 m to the northeast; and
- “Varathi (Mavroudi – Nea Selefkeia – Igoumenitsa)” (Code K237, GG 561/23-04-1985), located approximately 3,070 m to the northwest.

### 5.6.3 Forests, forested areas and reforestation areas

The infrastructure of the Project is located entirely within the Municipal Unit of Igoumenitsa and not within the boundaries of the ratified and published forest map of Igoumenitsa (Initially Ratified Forest Map under Article 17 of Law 3889/2010 (as amended and in force), approved by GG 531/D/24 December 2018). More specifically it is located within the marine area and the officially designated Land Zone of the Port of Igoumenitsa in an area coded as *OO: Other category in the past - Other category today*. Consequently, it is not situated within forests, forest lands, or reforested areas.

The ratified forest maps for the wider study area of the project site have not yet been published but can be found on the official website of the Hellenic Cadaster. According to these maps, areas located to the northwest, south and east of the project site are classified as forests and forest lands as presented in the figure below.

Figure 5-18: Published and ratified forest maps of the wider project area (Source: Hellenic Cadaster Forest Maps Portal<sup>36</sup>, accessed June 2026)

## 5.6.4 Social infrastructure and public utility facilities

### 5.6.4.1 Road network

A key feature of the land transportation network in the study area as it was first presented within the 2013 Study for the update of the Port of Igoumenitsa Masterplan, is the terminus of the Egnatia Motorway (yellow highlight in Figure 5-19 running in a west to east direction) at the southern edge of the city of Igoumenitsa, where the new port is located.

As previously mentioned, the Egnatia Motorway, a modern controlled-access highway, provides efficient and safe road connections between the area and Northern Greece, enabling short travel times and a high level of road safety.

Igoumenitsa is connected to the rest of Western Greece via the National Road, which terminates at the southern edge of the city.

The city's road network includes a principal transportation corridor, namely the coastal road (Agion Apostolon Street (purple highlight in Figure 5-19 running in a north to south direction), which further north is named Ethnikis Antistaseos Street). This road extends along the entire waterfront from the new port to the location of the proposed seaplane base (water aerodrome).

This main road corridor connects to the Preveza–Igoumenitsa National Road and the Egnatia Motorway to the south, as well as to the old Igoumenitsa–Ioannina National Road to the north.

A network of smaller local roads provides access to the individual districts and neighborhoods of the city.

<sup>36</sup> [EN | Ψηφιακός Χάρτης Κτηματολογίου](#)

#### 5.6.4.2 Air connections

Igoumenitsa is also served by Corfu Airport, through the regular ferry connection between Corfu and Igoumenitsa.

#### 5.6.4.3 Sewerage networks

The city of Igoumenitsa is served by a sewerage network. Wastewater is conveyed to the Wastewater Treatment Plant (WWTP) of Igoumenitsa (EL212001012), located at the western end of the Liotrivia peninsula (Figure 5-20), where it undergoes secondary treatment.

The Wastewater Treatment Plant of Igoumenitsa operates under the approved Environmental Terms (AEPO) of the municipal sewerage and wastewater treatment system, published in the GG in accordance with Law 4014/2011 and is the closest treatment plant to the Port of Igoumenitsa.

Figure 5-20: Wastewater Treatment Plants (WWTP) in the wider study area (Source: Special Secretariat for Water, Wastewater Treatment Plants Operation Monitoring Database<sup>37</sup>, accessed June 2026)

In the wider study area, the following wastewater treatment plants are located and operational (see the following table), which comply with the limits of Directive 91/271/EEC.

<sup>37</sup> [Wastewater Treatment Plants - Wastewater Treatment Plants Monitoring Database](#)

**Table 5-19: Wastewater Treatment Plants (WWTP) near the study area**

| NAME OF WWTP      | WWTP CODE     | TYPE OF TREATMENT                                               | TOTAL INCOMING FLOW TO THE WASTEWATER TREATMENT PLANT (WWTP) (M <sup>3</sup> /DAY) | RECEIVER       |
|-------------------|---------------|-----------------------------------------------------------------|------------------------------------------------------------------------------------|----------------|
| <b>FILIATES</b>   | EL212008018   | More stringent disinfection                                     | 968                                                                                | EL212008018    |
| <b>PARAMYHTIA</b> | EL21220040114 | More stringent nitrogen removal and disinfection                | -                                                                                  | EL212200401140 |
| <b>PARGA</b>      | EL214006016   | More stringent nitrogen and phosphorus removal and disinfection | 6,050                                                                              | EL2140060160   |

(Source: Special Secretariat for Water, Wastewater Treatment Plants Operation Monitoring Database accessed June 2026)

Regarding municipal solid waste management, waste collection is carried out by the services of the Municipality of Igoumenitsa, while final disposal takes place at the Igoumenitsa Sanitary Landfill for Residual Waste (XYTY Ηγουμενίτσας).

#### 5.6.4.4 Utility networks

The city of Igoumenitsa is served by the national electricity distribution network operated by the Hellenic Electricity Distribution Network Operator (HEDNO). Fixed-line telecommunications services are provided through the network of the Hellenic Telecommunications Organization (OTE), while the area is also covered by mobile telecommunications services.

Potable water is supplied through the municipal water distribution system. Water supply services are provided by the Municipal Water Supply and Sewerage Company of Igoumenitsa.

According to the National Registry of Water Abstraction Points (EMZY), in the immediate area of the Project's land facilities, a number of water abstraction points are identified as shown in Figure 5-21.

Figure 5-21: Water abstraction points near the Port of Igoumenitsa (Source: National Registry of Water Abstraction Points (EMSY)<sup>38</sup>, accessed June 2026).

## 5.6.5 Sites of archaeological interest

### 5.6.5.1 Underwater cultural heritage

Underwater and marine cultural heritage resources are protected under the same consolidated legislative framework as terrestrial heritage through L. 4858/2021 (GG A' 220/19.11.2021), which codified prior provisions, including those specifically addressing underwater antiquities. Under this framework, all ancient shipwrecks, submerged settlements, ancient harbours and port constructions, and artefacts of all kinds discovered in the sea, lakes or rivers are considered part of the Hellenic underwater cultural heritage and are the property of the Greek State.

The Law defines cultural goods as material evidence of human existence and activity, and distinguishes between ancient monuments, modern monuments, immovable monuments, movable monuments, archaeological sites, historical places and intangible cultural heritage.

Protection under Law 4858/2021 includes identification, research, recording, documentation, conservation, prevention of damage or alteration, prevention of illegal excavation and export, and promotion of public

<sup>38</sup> [Θέση σημείων υδροληψίας](#)

awareness. The protection of monuments, archaeological sites and historical places must also be considered in spatial, development, environmental and urban planning.

For underwater cultural heritage, the Law is particularly relevant because it expressly covers monuments and archaeological sites located on the seabed, in lakes and in rivers. It regulates underwater archaeological sites, shipwrecks, submerged remains and related activities such as diving, photography, archaeological investigation and seabed works. Shipwrecks more than 50 years old are subject to specific protection provisions, while any intervention, removal, movement or alteration of objects from wrecks or the surrounding seabed is prohibited without the required authorization.

Responsibility for the protection, management and archaeological investigation of underwater cultural heritage rests with the Ephorate of Underwater Antiquities (EUA), which constitutes the competent authority for the assessment and management of submerged archaeological resources.

The Project is considered compatible with Law 4858/2021 as it is not expected to cause direct or indirect damage, disturbance, alteration or removal of known or unknown underwater cultural heritage resources.

### 5.6.5.2 Onshore sites of archaeological interest

The main archaeological sites in the Regional Unit of Thesprotia within a 10km radius from the Port of Igoumenitsa are briefly described in Table 5-20 below:

**Table 5-20: Archaeological sites in the Regional Unit of Thesprotia within a 10 km radius from the Port of Igoumenitsa**

| DESCRIPTION                                                                                                                                | TYPE OF PROTECTION                                                                                                       | PROTECTION STATUS                                                                                                                                                                                                 | DISTANCE FROM THE PORT OF IGOUMENITSA |

| <p>Near the archaeological site and the modern dam of Kalamas, part of the Cemetery of Gitana has been found, with the most characteristic find being a cist tomb.</p>                                                                                                                                                                                                                                                                                                              | <p>Type of protection by the Ministry of Culture: Listing</p> <p>Competent Authority: Ephorate of Antiquities of Thesprotia</p> | <p>GG 35/B/1962-02-02, Ministerial Decision 15794,</p>                                                                                                                                                                                                                            | ~ 9 km N                              |

(Source: Archaeological Cadaster <sup>39</sup>, June 2026)

<sup>39</sup> [Archaeological Cadaster](#)

Within a radius of 10 km from the study area, the following ancient monuments are also identified (the relevant distances are presented in the following table):

**Table 5-21: Ancient monuments in the Regional Unit of Thesprotia within a 10 km radius from the Port of Igoumenitsa**

| MONUMENT - TEMPLE                                          | DISTANCE FROM THE PORT OF IGOUMENITSA (APPROXIMATE DISTANCE FROM THE CENTRE OF THE PORT) | WITHIN THE STUDY AREA |
|------------------------------------------------------------|------------------------------------------------------------------------------------------|-----------------------|
| Fortress of Igoumenitsa, Thesprotia                        | 1km NNW                                                                                  | No                    |
| Windmill, Graikochori                                      | 2km ESE                                                                                  | No                    |
| Holy Monastery of Zoodochos Pigi, Agionisi                 | 4km W                                                                                    | No                    |
| Vasiliki, Islet of Prasoudi                                | 9km W                                                                                    | No                    |
| Pyrgos (Koulia) Ragiou                                     | 7km NW                                                                                   | No                    |
| Holy Monastery of the Assumption of the Virgin Mary, Ragio | 10km N                                                                                   | No                    |
| Ancient Theatre of Gitanoi                                 | 9km N                                                                                    | No                    |

(Source: Archaeological Cadaster, June 2026)

The traditional settlement of Kamitsani, is a residential complex of historical, urban planning, architectural, folkloric, social, and aesthetic character, developed from the 16th to the 19th century. The settlement has been designated as Traditional in the Prefecture of Thesprotia, pursuant to Presidential Decree 19-10-1978 (GG 594/D/13.11.1978).

The project under study is not expected to cause any damage to the protected monuments of the archaeological site, as they are located at a significant distance from the proposed intervention areas. Furthermore, it should be noted that the interventions related to the Project will be of short duration and will concern a limited area of the wider Port of Igoumenitsa.

In any case, to ensure the protection of the cultural environment of the study area in accordance with the requirements of Law 3028/2002, as amended and currently in force, as detailed in Chapter 12, the proposed interventions will be carried out under the supervision of the competent archaeological authorities following timely and written notification prior to the commencement of works, which is the responsibility of the project operator.

## 5.7 Applicable spatial and urban planning regulations in the project area

This section presents the key spatial planning policies that have been established at the level of Strategic Spatial Planning for the study area in accordance with Law 4447/2016. Subsequently, Law 4759/2020 is Greece's core spatial planning reform law that modernized and reorganized the entire planning system, establishing a clearer hierarchy of national, regional, and local plans and strengthening sector frameworks like ports, energy, and urban development. and examines the compatibility of the proposed project with these policies.

## 5.7.1 Provisions and Guidelines of the General and Regional Frameworks for Spatial Planning and Sustainable Development

### 5.7.1.1 General Framework for Spatial Planning and Sustainable Development (GFSPSD)

The applicable General Framework for Spatial Planning and Sustainable Development (GFSPSD), approved by *Decision 6876/4871/2008* of the Parliament (GG 128/A/03-07-2008), in accordance with *Article 12(3) of Law 4447/2016*, as in force, serves as the National Spatial Strategy. It includes a set of texts and plans that record and assess the factors affecting the long-term spatial development and structure of the national territory, evaluate the spatial impacts of international, European, and national policies, and determine, with a 15-year outlook, the key priorities and strategic directions for integrated spatial development and sustainable organization of national space.

More specifically, in view of the acute problems caused by rapidly progressing climate change, the following goals are set:

- Ongoing efforts for energy conservation
- Promotion of environmentally friendly alternative energy sources, especially renewable energy sources
- Enhancement of natural feedback mechanisms (forests, wetlands, etc.)
- Adaptation of the country to the new conditions brought about by climate change and addressing their consequences (wildfires, floods and erosion, drought, salinization, desertification, and other natural phenomena), through the creation of appropriate preventive mechanisms, infrastructure, and action plans.

Regarding the spatial organization and development of the industrial sector (mining – manufacturing), according to Article 7, Section C of the GFSPSD, the following key goals and objectives are set:

- Promotion of a polycentric spatial organization model for industry in order to enhance its contribution to regional development and the exploitation of the comparative advantages of various areas.
- Resolution of land-use conflicts and ensuring conditions for the coexistence of activities, considering the uniqueness and availability of resources for the development of each productive activity and weighing social-economic and environmental costs/benefits.
- Enhancement of competitiveness and entrepreneurship in the industrial sector through appropriate spatial regulations, focusing on activities that meet local needs and have a comparative advantage in international markets.
- Improvement and coordination of the institutional provisions of individual spatial policies, to more effectively promote entrepreneurship and ensure transparency and legal certainty in the siting of industrial activities.
- Integration of the environmental dimension into industrial activities through the application of modern exploitation and production techniques, as well as anti-pollution and environmental restoration technologies.

According to Article 10 of the GFSPSD, in relation to climate change mitigation, in addition to measures for the protection of water, soil, and air, the following are also promoted:

- Plans for the use of renewable energy sources.

- Promotion of less energy-intensive transport modes.
- Infrastructure for the widespread use of natural gas (especially in electricity production).
- Obligatory reduction of pollutant gas emissions contributing to the greenhouse effect by industries.
- Application of best available techniques in industries.
- Energy saving measures.
- Forest fire prevention measures and reforestation.
- Applications of bioclimatic architecture, etc.
- Strengthening of natural feedback mechanisms (forests, wetlands, etc.) and their biodiversity.

The project does not conflict with the broader goals established by GFSPSD.

### 5.7.1.2 Regional Spatial Framework of the Region of Epirus

The Regional Spatial Framework (RSF) of the Region of Epirus<sup>40</sup> replaces the previous Regional Framework for Spatial Planning and Sustainable Development of the same region approved by Ministerial Decision 25301/2003, “Approval of the Regional Framework for Spatial Planning and Sustainable Development of the Region of Epirus” (GG B’ 1451/2003).

Administratively, the area falls under the jurisdiction of the Municipality of Igoumenitsa, within the Regional Unit of Thesprotia, Region of Epirus. The cities of Arta, Igoumenitsa and Preveza are the administrative capitals of the Regional Units of Arta, Thesprotia and Preveza, respectively, and together with Ioannina constitute the principal urban centers of the Region.

These urban centers provide services of both local and supra-local (regional) significance throughout their respective Regional Units.

The recently approved Revised Regional Spatial Framework of the Region of Epirus, adopted by *Ministerial Decision ΥΠΕΝ/ΔΧΩΠΣ/78523/1208* and published in GG 286 ΑΑΠ/28-11-2018, provides policy directions concerning Igoumenitsa that are closely linked to its port. These include:

- Development opportunities related to transit trade, maritime transport, and tourism.
- Promotion of outward-oriented cooperation with Southern Albania, the Ionian region, and the Adriatic region.

<sup>40</sup> [https://ypen.gov.gr/wp-content/uploads/2020/11/20200728\\_Hpeiros\\_FEK.pdf](https://ypen.gov.gr/wp-content/uploads/2020/11/20200728_Hpeiros_FEK.pdf)

Figure 5-22: Spatial Development Model of the Region of Epirus (Source: Map Π-1 of the Regional Spatial Framework of the Region of Epirus, 2018).

The area is considered suitable for the development of freight and transit / logistics activities, in combination with the Port of Igoumenitsa.

Furthermore, the completion of the port works as described within the Igoumenitsa Port masterplan (2013), should ensure the port's ability to assume alternative future roles, including:

- a cruise port,
- a ship bunkering port,
- a commercial freight port,
- a support port for activities associated with hydrocarbon exploration and exploitation in Epirus and the Northern Ionian Sea

The Regional Spatial Framework of Epirus (GG 286/ΑΑΠ/28.11.2018) identifies the Port of Igoumenitsa as the principal international maritime gateway of Western Greece and a strategic development pole for the Region.

The Framework establishes the wider key planning directions, heavily involving the Port of Igoumenitsa as per the list of objectives below:

## 1. International Gateway and Transport Hub

- Recognition of Igoumenitsa as a major gateway connecting Greece with Italy and Western Europe.
- Strengthening of the port's role through completion of strategic transport infrastructure, including the E65 Motorway, the Western Axis, railway connections and the upgrading of Ioannina Airport.
- Reinforcement of the port's integration with the Egnatia Motorway corridor.

## 2. Logistics and Freight Development

- Promotion of freight, logistics and transshipment activities associated with the port.
- Identification of Igoumenitsa as a potential logistics hub serving Epirus, Thessaly, Southern Albania and the wider Adriatic region.
- Support for the development of freight and intermodal transport infrastructure.

### **3. Cross-Border and Adriatic Cooperation**

- Promotion of economic and transport links with Southern Albania.
- Support for cross-border cooperation within the Adriatic-Ionian area.
- Priority for the coastal connection between Igoumenitsa and Mavromati.

### **4. Port Diversification**

The Framework requires that future port development maintain the flexibility to support:

- passenger ferry traffic,
- freight transport,
- cruise tourism,
- ship bunkering services,
- and support activities related to hydrocarbon exploration and production in the Northern Ionian and Epirus regions.

### **5. Tourism Development**

- Recognition of the wider coastal zone (Parga–Perdika–Syvota–Plataria–Igoumenitsa) as the most dynamic tourism area of Epirus.
- Strengthening of Igoumenitsa's role as a tourism gateway and cruise destination.
- Integration of the coastal tourism market with the wider Southern Adriatic tourism region.

### **6. Maritime Tourism Infrastructure**

The Framework specifically proposes:

- a marina in the Igoumenitsa area,
- anchorage facilities in the Perdika–Syvota area,
- integration of Igoumenitsa into the Ionian yachting network alongside Corfu, Paxi and Lefkada.
- development of cruise-support infrastructure at the Port of Igoumenitsa.

### **7. Coastal Zone Management**

- Protection and rational management of coastal land uses.
- Restriction of uncontrolled out-of-plan development.
- Control of competing land uses in the coastal zone.
- Promotion of sustainable tourism development and stronger links between tourism and the primary sector.

As such, at the regional strategic planning level, the support base for the hydrocarbon exploration Project under assessment is consistent with the adopted spatial strategy for the Region of Epirus, and specifically with the city of Igoumenitsa and its port.

## 5.7.2 Special Spatial Planning and Sustainable Development Frameworks

This section examines the compatibility of the project with the provisions and guidelines of the following Special Spatial Planning and Sustainable Development Frameworks (SSPSDFs) that have been institutionalized to date and may be related to the activities and facilities of the project under assessment:

- SSPSDF for Renewable Energy Sources (JMD 49828/2008, GG 2464/B/2008), (currently under revision).
- SSPSDF for Industry (JMD 11508/2009, GG 151/AAP/2009).
- SSPSDF for Aquaculture (JMD 31722/2011, GG 2505/B/2011).

### 5.7.2.1 Special Spatial Planning and Sustainable Development Framework for Renewable Energy Sources (RES)

The Special Spatial Planning and Sustainable Development Framework for Renewable Energy Sources (SSPSDF-RES), approved by JMD 49828/2008 (GG 2464/B/2008), concerns the comprehensive spatial planning of all categories of RES projects throughout Greece. According to Article 1, the minimum goal of the SSPSDF-RES is to achieve Greece's contractual targets for addressing climate change and promoting RES, as derived from its European and international obligations.

According to the Special Framework for Spatial Planning and Sustainable Development for Renewable Energy Sources (RES), JMD 49828/2008 (GG 2464 B/3-12-2008), the area under examination is **not** located within Wind Energy Priority Areas (P.A.P.) or Wind Energy Suitability Areas (P.A.K.).

In the Region of Epirus, no areas of major importance have been designated for the siting of wind energy installations and hydroelectric projects aimed at exploiting wind and hydropower potential. Furthermore, no specific zones for other Renewable Energy Sources (solar energy, biomass, and biogas) have been identified in the immediate area proposed for the project.

Therefore, according to the Special Spatial Planning Framework for Renewable Energy Sources, no specific spatial planning directives or restrictions apply to the immediate area in which the proposed project is to be located.

It is noted that the SSPSDF-RES is currently under revision, with no definitive approval date available at this time.

The project under assessment is not directly related to this framework, as it does not concern a RES project. However, it is worth noting that since it will temporarily form part of the wider Port of Igoumenitsa, it is not expected to negatively impact its provisions or planning in any way.

### 5.7.2.2 Special Spatial Planning and Sustainable Development Framework for Aquaculture

The SSPSDF for Aquaculture (SSPSDF–Aqua), issued by GG 2505/B/2011, addresses the categorization of four specific aquaculture sectors:

- Marine aquaculture (excluding shellfish farming).
- Shellfish farming.
- Freshwater aquaculture.
- Aquaculture of aquatic organisms in natural brackish ecosystems.

The SSPSDF–Aqua defines the spatial planning framework at two levels:

- Spatial allocation and planning of aquaculture units in the marine area.
- Spatial allocation and planning of the main production activities, associated, and supporting facilities in the terrestrial area.

The framework identifies and categorizes suitable areas for aquaculture development (referred to as Areas of Aquaculture Development – AAD) / Π.Α.Υ., based on their characteristics and the current level of aquaculture activity. These areas reflect the suitability for aquaculture development. From a spatial planning perspective, they represent broader search zones for hosting areas (Organized Aquaculture Development Areas – OADA / Π.Ο.Α.Υ. or Informal Unit Clusters – IUC / Π.Α.Σ.Μ.) and individual units.

These areas are classified into five (5) categories:

- Highly developed areas requiring improvements, infrastructure modernization, and environmental protection and enhancement.
- Areas with significant potential for further development of marine aquaculture.
- Remote areas with high potential for marine aquaculture development.
- Environmentally sensitive areas where installation and operation conditions must be adapted to the specific environmental characteristics.
- Spot-location areas.

The standard model for marine aquaculture unit placement includes the installation of units within Areas of Aquaculture Development (AAD) and the establishment of individual units.

Specifically, units may be installed:

- Within AADs:
- In Organized Aquaculture Development Areas (OADA), as defined in Article 10 of Law 2742/1999 (as currently in force).
- In Informal Unit Clusters (IUC), which represent a transitional phase toward organized OADAs.
- Individually.
- At individual sites, within or outside AADs, subject to specific criteria

According to the Aquaculture Spatial Planning Framework (GG 2505/B/04.11.2011), within the Regional Unit of Thesprotia, there is one of the particularly developed Aquaculture Development Areas (A.D.A.), namely

Area A.1: Sagiada–Kalamas–Valtos Ragiou, with its main aquaculture activity being represented by Fish farming – Shellfish farming – Other aquatic organisms.

This area included the recommended following zones to form Organized Aquaculture Development Areas – Π.Ο.Α.Υ.): Sagiada Coastal Strip, Valtos Bay, Akra Gonia, Kalamas I, and Kalamas II.

In addition, the aforementioned Aquaculture Development Area includes a fish seed production facility (hatchery), while two packaging and production facilities for unprocessed fishery products are located in its vicinity.

According to the *2nd Revision of the River Basin Management Plans for the Epirus River Basin District (EL05)*<sup>41</sup>, the study area lies within the Kalamás River Basin (EL0512). In this area, there are currently thirty-nine (39) operating aquaculture units, of which twenty-six (26) cultivate marine species, while the remaining thirteen (13) are engaged in freshwater aquaculture.

Furthermore, as part of the conditions for the approval of new aquaculture facilities, the management plans<sup>42</sup> establish measure M05B0704 and link the National Maritime Spatial Strategy (NMSS) with the implementation of measures concerning commercially important fish stocks, specifically *Measure 3.4.8: “Development of a unified Maritime Spatial Planning framework with provisions for fisheries and aquaculture,”* as well as measures aimed at mitigating eutrophication, namely *Measure 5.4.2: “Design and implementation of good operational practices and monitoring in aquaculture installations.”*

Given its limited operational capacity and the fact that the supply base under consideration will form part of the wider Port of Igoumenitsa that has already obtained environmental permitting, it is not expected to further affect the uses of the AAD. Therefore, the project is considered compatible with the SSPSDF for Aquaculture.

### 5.7.2.3 Special Spatial Planning and Sustainable Development Framework for Industry

The *Special Framework for Spatial Planning and Sustainable Development for Industry* (Decision 11508/18.02.2009 of the Committee for the Coordination of Government Policy in the field of Spatial Planning and Sustainable Development, GG 151/AAP/2009) provides the strategic framework and guidelines for industrial development in Greece (Figure 5-23).

<sup>41</sup> [https://wfdver.ypeka.gr/wp-content/uploads/2026/04/%CE%95L05\\_2REV\\_PIESEIS.pdf](https://wfdver.ypeka.gr/wp-content/uploads/2026/04/%CE%95L05_2REV_PIESEIS.pdf)

<sup>42</sup> [https://wfdver.ypeka.gr/wp-content/uploads/2026/04/EL05\\_2REV\\_Programma\\_Metrwn.pdf](https://wfdver.ypeka.gr/wp-content/uploads/2026/04/EL05_2REV_Programma_Metrwn.pdf)

Figure 5-23: Guidelines for spatial policy implementation for industry at the prefectural level (Source: Map 2 of the Special Spatial Framework for Industry, 2009)

According to the Special Framework for Industry, Igoumenitsa forms part of the areas where industry can play a particularly important role, complementary to other local characteristics, due to its position as one of the country's principal international gateways and as a hub for intermodal transport and major infrastructure networks (Figure 5-24).

The specific directions provided for the Regional Unit of Thesprotia are as follows:

- **General priority for spatial policy regarding manufacturing:** Medium (1.0), primarily as a strategic development option associated with the emerging role of Igoumenitsa.
- **Sectoral priorities:** At present, there is no clearly defined industrial profile. To capitalize on future opportunities, the preparation of a dedicated development plan will be required, based on the range of activities attracted by the area's high accessibility. With regard to manufacturing, prospects relate to sectors that benefit from supra-local accessibility and therefore involve enterprises of a certain scale and outward orientation, as well as activities that complement trade and logistics services.
- **Spatial pattern of industrial development:** Manufacturing activities are concentrated within the Igoumenitsa–Paramythia–Filiates area; however, due to their relatively limited scale, they do not currently constitute a genuine industrial concentration zone. Ongoing improvements in transport infrastructure are creating new comparative advantages, significantly strengthening the role of Igoumenitsa and encouraging development towards the east. The establishment of a free trade zone in connection with the Port of Igoumenitsa also represents a potential future development opportunity.
- **Planned industrial location:** The recently established Industrial and Business Park (BIO.PA.) should be

further supported through appropriate urban planning measures.

- **Land uses and relationship with other activities:** The increasing tourism specialization of the Regional Unit, which functions as a coherent tourism area, means that any future expansion of the industrial base could potentially generate land-use conflicts. Nevertheless, tourism development is expected to remain primarily focused on the coastal zone, whereas industrial development does not prioritize coastal locations.
- For areas characterized by a particularly limited industrial presence, a Type 5 policy approach is recommended, aimed at addressing internal development disparities within the Regional Unit and supporting balanced territorial development.

**Figure 5-24: National Spatial Organization of Industry (Source: *National Spatial Planning and Sustainable Development Framework for the Industrial Sector*)**

The Industrial Park (VIOPA) of Thesprotia was initially defined and spatially delimited with *JMD 14721/809*, covering an area of approximately 230,000 m<sup>2</sup> (23 hectares), within the administrative boundaries of the Municipality of Paramythia, Regional Unit of Thesprotia, Greece.

The BIO.PA, currently falls within the Kastri Municipal District (former administrative unit), a settlement and former municipal district within the Regional Unit of Thesprotia, Epirus Region, Greece. Following the implementation of the “Kallikratis” reform (Law 3852/2010), it was incorporated into the Municipality of Igoumenitsa.

The designated area was intended for the installation, relocation, and operation of industrial and craft enterprises, as defined under Article 2 of Law 2545/1997 (GG 254/A/1997) concerning the development of organized industrial and business areas.

The establishment of the BIO.PA (ΒΙΟ.ΠΑ) aimed to concentrate productive activities in a structured and regulated spatial framework, ensuring orderly industrial development, improved infrastructure provision, and compliance with applicable environmental and planning regulations.

The Decision also approved the establishment of the BEPE (ΒΕΠΕ) development entity and the accompanying Environmental Impact Assessment (EIA) study for the project, in accordance with the provisions of Law 2545/1997 on Industrial and Business Areas.

Ministerial Decision A/7.7/4487/320/2003 (GG 657/B/06.05.2004), later approved the Operational Regulation of the Thesprotia Industrial Park (VIOPA). The Regulation established the operational framework governing land use, conditions for the installation of enterprises, and the management structure of the organized industrial area, in accordance with Law 2545/1997 on Industrial and Business Areas.

Under the approved GUP for the Municipal Unit of Igoumenitsa (Section 5.6.1), the area under consideration has been designated as Port Zone B4.5, within which no land uses or activities other than port-related activities are envisaged.

The existing and proposed Port Zone boundaries are maintained in accordance with the Igoumenitsa Port Master Plan and the decisions of the Port Planning and Development Committee (ESAL), namely Decision 02/10.12.2002 of the 4th ESAL Session and Decision 02/17.12.2004 of the 15th ESAL Session.

The determination of land uses within the Port Zone does not fall within the scope of the General Urban Plan but is the responsibility of the Port Planning and Development Committee (ESAL), pursuant to Article 19 of Law 2932/2001 (GG 145/A/2001) and Law 2971/2001 (GG 285/A/2001).

Permitted uses within the Port Zone include port facilities, infrastructure, and associated developments in accordance with the approved Port Development Master Plan and any subsequent relevant planning or technical studies.

Regarding the onshore facilities of the Project, these are located in an area designated as "Port Zone" according to the General Urban Plan (GUP) of the Municipality of Igoumenitsa, and they are consistent with the directions and requirements of both this Plan and the National Spatial Planning Framework for Industry (SPPF-I). Overall, the project under study is considered consistent with the specifications, requirements, and guidelines of the aforementioned SPPF-I.

### 5.7.3 Legal Framework of Land Uses in the Study Area

The following land uses are established near the port zone, as presented in Figure 5-25:

- Central City Functions, and
- B.3.4. PEPD 4: Off-Plan Zone A (marked 3.4), which is a peri-urban area of the Municipality that develops along a coastal zone and in zones with a width of 500 m around the urban complex of Igoumenitsa and a width of 200 m around the settlements of Mavroudi, Kastri, Agios Vlasios, the proposed extensions, and Specially Regulated Urban Development Areas (ΠΕΡΠΟ), which either have or are developing an urban character.

In PEPD 4, poultry and livestock installations, slaughterhouses, medium and high-impact industrial installations, quarries for aggregates, and marble cutting and processing units are prohibited.

Figure 5-25: Land uses near the Igoumenitsa Port

The existing and proposed Port Zone boundaries are maintained in accordance with the Igoumenitsa Port Master Plan and the decisions of the Port Planning and Development Committee (ESAL), namely *Decision 02/10.12.2002* of the 4th ESAL Session and *Decision 02/17.12.2004* of the 15th ESAL Session.

The determination of land uses within the Port Zone does not fall within the scope of the General Urban Plan but is the responsibility of the Port Planning and Development Committee (ESAL), pursuant to Article 19 of Law 2932/2001 (GG 145/A/2001) and Law 2971/2001 (GG 285/A/2001).

Permitted uses within the Port Zone include port facilities, infrastructure, and associated developments in accordance with the approved Port Development Master Plan

More specifically, *Ministerial Decision 8216/126/14 "Revision of the Port Master Plan of Igoumenitsa"* approves the Update of the Port Master Plan of Igoumenitsa, as it is depicted in the attachment drawings of the Decision document: (a) drawing G-02 entitled 'General Layout of the Port (Completion of the works of Phase C is foreseen)' (Scale 1:2500, December 2013) and (b) drawing G-04 entitled 'Land Uses – Building Regulations of the port' (Scale 1:2000, December 2013) of OLIG SA, in cooperation with the Technical Advisor consisting of the partner consulting engineering firms ADK Consulting Engineers SA and TRITON Consulting Engineers Ltd.

Specifically, the changes in the spatial structure and future functions are approved for each of the following areas/sectors of the port:

- Old Port Area
- Ferry Service Area
- Cruise Service Area

- Central Area of International Lines
- Unaccompanied Cargo Management Area and Ro-Ro vessel service area
- Southern (Supplementary) Area of International Lines

Defining in detail terms and constraints relating to:

- port building facilities
- quay wall lengths
- description of parking areas
- operational areas within the controlled port land zone
- existing, under-construction and proposed facilities terms and limitations of development
- Permitted land uses in their majority characterized as either a.) Services – Storage or b.) Services – Commercial Zone – Storage.

According to the study for the revision of the Port of Igoumenitsa Masterplan in December 2013 with the completion of the construction works of Phase C, the Port of Igoumenitsa would have a total land area/zone of approximately 49.7 hectares.

In addition, with the proposed implementation of the marina in the north-eastern sector of the Igoumenitsa bay, this specific land area would be increased by approximately 34 hectares.

Regarding the port's land zone, up to that date the development/delimitation of eight building blocks (OT 1 to OT 8) had been approved, located within the land areas of the three development phases (A, B, and C). Permitted land uses are defined by the relevant approval decisions under the terms "Services, Commercial Zone and Warehouses."

The term "Services" covers a particularly broad range of port activities, as it defines services performed/provided within the port zone. In relation to the operation of the Port of Igoumenitsa, the following services fall within this term:

- Control and management services for passengers and circulating passenger vehicles (I.X.) provided by entities such as the Port Authority, Customs, Police, and private transport companies.
- Control and management services for circulating goods transported by freight vehicles (G.X.) or other means, provided by the same authorities.
- Accommodation of personnel of the above-mentioned services, as well as supporting facilities necessary for their operation (office spaces, parking areas for passenger vehicles, etc.).
- Supporting infrastructure for passenger and freight transport services, such as temporary vehicle parking areas, cargo consolidation and handling areas (open-air or covered).

The term "Commercial Zone" mainly concerns the possibility of commercial activities/transactions between private individuals or companies within the port facilities. It ranges from simple commercial transactions between passengers and private companies within or outside terminal buildings (e.g. shops, ticket offices, cafés, restaurants, etc.) to commercial transactions of private transport companies for goods transport (regardless of form of handling/packaging) carried out within the port zone. An application of the above provision also includes a private company for the management of unaccompanied cargo, which will operate in the future within the port, possibly within the framework of a concession agreement.

The term “Warehouses” refers to covered/enclosed spaces for the storage of goods, mechanical equipment, and other equipment, whether for temporary storage/holding (transit cargo) or for permanent/continuous storage.

A Concession Agreement was also recently signed on March 21, 2023, between the consortium Grimaldi Euromed S.p.A – Minoan Lines SA – Investment Construction Commercial and Industrial SA and the Greek State. The company under the corporate name “Igoumenitsa Port Authority SA” (OLIG SA) has the right to exclusively use and operate the buildings, land and facilities of four (4) ports, namely, the port of Igoumenitsa, the fishing shelter of Sagiada, the fishing shelter of Platania and the pleasure boat shelter of Sivota, which are located in northwestern Greece, in the administrative region of Epirus, by virtue of the Concession Agreement with the Hellenic Republic. The Concession Agreement has a duration of 60 years from its signing, thus expiring on February 3rd, 2062.

## 5.7.4 Special Management Plans

### 5.7.4.1.1 National Waste Management Plan (NWMP)

The National Waste Management Plan (NWMP) was approved by *Cabinet Act 39/31-08-2020 (GG 185/A/2020)* and amended by *Cabinet Act 5 of 18.4.2023 (GG 94/A/18.4.2023)*. It was drafted in accordance with Articles 22 and 35 of Law 4042/2012 (GG 24/A/2012) for the implementation of Article 28 of Directive 2008/98/EC, with a time horizon of 2020–2030. The NWMP sets out strategic directions for reducing the negative impacts of waste generation and management, decreasing the overall impact of natural resource use, and improving resource efficiency in order to achieve the desired high level of protection of the environment and human health.

In this context, the new National Waste Management Plan (NWMP) sets as its primary goal the reduction of municipal solid waste (MSW) landfilling to less than 10% by 2030. Achieving this target will be pursued through a series of measures, including waste prevention, the introduction of new and the strengthening of existing separate waste streams, the promotion of reuse, the increase of recycling rates, the development of the secondary materials market, public information and awareness campaigns, the rapid development of bio-waste and recyclable material collection networks, the creation of modern waste and bio-waste management facilities (WMFs and BWMFs), the significant upgrade of Material Recovery Facilities (MRFs), and, within this framework, the utilization of Waste Treatment Units (WTUs) and Recycling Recovery Units (RRUs) for the sorting of recyclable materials. It also includes the calculation, per municipality, of the quantity of recyclable materials and corresponding impurities, as well as the energy recovery of alternative (secondary/refuse-derived) fuels and processing residues.

Particular emphasis is also placed on recycling and Source Separation (SS), with the separate collection of bio-waste implemented nationwide by the end of 2022. At the same time, the plan calls for intensified efforts for the separate collection of four recyclable waste streams, giving priority to strengthening the collection of recyclable materials.

Within the framework of the new NWMP, waste is grouped into the following streams, as shown in the table below.

The main waste streams that may be generated during the construction of the Project, which fall under the categorization of the approved NWMP, are as follows:

- I. Municipal-Type Waste
- II. Excavation, Construction, and Demolition Waste (ECDW).
- III. Other waste streams subject to alternative management.

The proposed Project meets the specifications for prevention, minimization, and proper management of the above waste streams as recommended by the NWMP. Each waste stream generated will be managed in accordance with the provisions of the applicable legislation, as detailed in the Waste Management Plan (WMP) of the project, which accompanies this document. The WMP includes practices for the prevention and minimization of generated waste and the management methodology for each waste stream. The final disposal of each waste stream will be carried out by appropriately licensed entities and alternative management systems in accordance with the current applicable legislation.

#### 5.7.4.1.2 National Hazardous Waste Management Plan (NHWMP)

The National Hazardous Waste Management Plan (NHWMP) was approved by *Ministerial Decision 62952/5384/2016 (GG 4326/B/2016)* and was drafted in accordance with Article 31 of Law 4342/2015 for the implementation of Articles 22 and 23 of Law 4042/2012 as currently in force. The objective of the NHWMP is to promote, through integrated and rational management of hazardous waste, the waste hierarchy set out in Directive 2008/98/EC in order to reduce impacts on the environment and public health. At the same time, waste management is intended to contribute positively to economic and social development. Within the framework of the NHWMP, hazardous waste is grouped into the following streams:

- Industrial hazardous waste (IHW).
- Hazardous waste from healthcare units (HWU).
- Hazardous waste from public utility, public service, etc. installations (PUW).
- Hazardous waste subject to alternative management:
- Waste oils (WO).
- Waste from vehicle and industrial batteries (WVIB).
- Waste from portable electric batteries and accumulators (WPEBA).
- Waste subject to alternative management that are hazardous or generate hazardous waste during their decontamination: Hazardous waste from end-of-life vehicle decontamination (ELV), waste lamps containing hazardous substances, hazardous waste from decontamination of electrical and electronic equipment (WEEE).
- Waste containing asbestos (hazardous C&D waste).
- Small quantities of hazardous waste in Municipal Solid Waste (SQHW).
- Packaging waste containing hazardous substances.
- Waste containing polychlorinated biphenyls/triphenyls (PCB/TP).

The main streams of hazardous waste expected to be generated during the construction of the project, which fall under the above NHWMP categorization, are as follows:

- Packaging waste containing hazardous substances.
- Drilling waste containing hydrocarbons.
- Hazardous waste subject to alternative management (waste oils, WEEE, lamps, etc.).

The project is consistent with the principles of prevention, minimisation and proper management set out in the NHWMP for the above waste streams, as each hazardous waste stream generated will be managed in accordance with applicable legislation and the project-specific measures described in the Waste Management Plan (WMP) accompanying this ESIA.

#### 5.7.4.1.3 Regional Waste Management Plan (RWMP) of the Region of Epirus

Recently, the revision of the aforementioned plan was approved by JMD 44015/4029/15.09.2016 of the Ministers of Interior and Administrative Reconstruction and Environment and Energy (GG 3196/B/05.10.2016). The previous Regional Solid Waste Management Plan (PESDA) for the Region of Epirus was approved by Decision 6077/28.12.2004 of the Secretary General of the Region of Epirus. The PESDA and its revision constitute the regional implementation, within the territory of the Region of Epirus, of the general policy directions set out in the National Waste Management Plan (ESDA) (JMD 50910/2727/22.12.2003, GG 1909/B/22.12.2003), as subsequently amended, as well as the National Strategic Waste Prevention Programme, as ratified by JMD 51373/4684/25.11.2015 of the Ministers of Interior and Administrative Reconstruction and Environment and Energy (GG 2709/B/15.12.2015), in accordance with Article 31 of Law 4342/2015.

The Region of Epirus comprises four Waste Management Units (WMUs):

- 1st Waste Management Unit: Ioannina Prefecture.
- 2nd Waste Management Unit: Part of the Thesprotia and Preveza Prefectures.
- 3rd Waste Management Unit: Arta Prefecture and part of the Preveza Prefecture.
- 4th Waste Management Unit: Part of the Thesprotia Prefecture.

The Municipality of Igoumenitsa is included within the 2nd Waste Management Unit (WMU) and is served by the Igoumenitsa Landfill Facility, located near Parapotamos settlement at a distance of approximately 7 km from Igoumenitsa, and by the Igoumenitsa Waste Transfer Station (WTS), located near Agia Marina settlement, approximately 7 km from the city.

The proposed project is not expected to interfere with, nor be adversely affected by, the above waste management facilities and their associated operations.

The principal strategies and actions of the present Plan are summarized as follows:

- Establishment of separate collection systems for waste streams, at least for glass, paper, metals, and plastics, in order to ensure that at least 65% by weight of these materials is recycled through source separation by 2020.
- Establishment of separate collection of biowaste, with the objective of achieving separate collection of 40% by weight of the total biowaste generated by 2020, and treatment of the separately collected biowaste in decentralized composting facilities within each Regional Unit, aiming at the production of high-quality compost.

- Development of a dense network of Green Points (Green Collection Points) and implementation of measures to strengthen source separation by citizens for almost all waste streams, in order to achieve, at a minimum, the targets set by Law 4042/2012 by 2020.
- With regard to Construction and Demolition Waste (CDW), and in order to achieve the objectives of Article 11 of Directive 2008/98/EC, the Plan provides for the immediate establishment of four Recovery Facilities, one in each Regional Unit, and at least one inert waste landfill, together with the implementation of the extended producer responsibility (EPR) principle through the creation of an Alternative Management System.
- Development of facilities for the recovery and utilization of sewage sludge produced by the major Wastewater Treatment Plants (WWTPs) of the Region, as well as facilities for the treatment of livestock manure, considering that its management constitutes a major issue in the area. These projects may be implemented by either public or private entities.
- Implementation of co-treatment (co-processing) actions for industrial waste, within the framework of developing new waste-management infrastructure for Municipal Solid Waste (MSW), Animal By-Products (ABPs), and Agricultural Waste.
- Implementation of a Waste Prevention Programme, comprising targeted actions for citizens, businesses, and other stakeholders, with the objective of stabilizing waste generation at current levels.

The Quality of Life Committee of the Municipality of Igoumenitsa also convened in a regular public session in the Municipal Council hall, following the written invitation 4741/24-03-2022 by its Chairperson. During the session, the Committee approved the Final Updated Local Waste Management Plan (LWMP) of the Municipality of Igoumenitsa, which constitutes an integral part of *Decision 11/2022* approving it.

The waste management system of the Project aligns with the above directions of the updated RWMP and LWMP, as mentioned earlier, since during preparation and operation, practices for prevention and minimization of waste generation are foreseen, along with appropriate management of each waste stream according to the applicable legislation, as detailed in the Project's Waste Management Plan (WMP) accompanying this document.

#### 5.7.4.1.4 River Basin Management Plans for the Water District of Epirus (EL05)

The River Basin Management Plan (RBMP) of the Epirus River Basin District (EL05), was approved by Decision 1005/04.09.2013 of the National Water Committee (GG 2292/B/13.09.2013), its 1st revision, which was approved by Decision 907/21.12.2017 of the National Water Committee (GG 4664/B/29.12.2017) and its 2<sup>nd</sup> revision which was approved by GG A' 71/17.05.2024 – “Approval of the 2nd Revision of the River Basin Management Plan of the Epirus River Basin District (EL05)”<sup>43</sup>

The River Basin Management Plan of the Epirus River Basin District was prepared in accordance with Directive 2000/60/EC “establishing a framework for Community action in the field of water policy”.

According to the official website of the Ministry of Environment and Energy, River Basin Management Plans are reviewed and updated every six years. The first Management Plans refer to the 1st Management Cycle

<sup>43</sup> [Εγκεκριμένα Σχέδια Διαχείρισης 2ης Αναθεώρησης ΥΔ \(EL05\) Ηπείρου – Σχέδια Διαχείρισης ΛΑΠ](#)

(2009–2015) and remain in force until their revision. The Management Plans prepared under the 1st Revision of the River Basin Management Plans of the 14 River Basin Districts of the country, in accordance with Directive 2000/60/EC, refer to the 2nd Management Cycle (2016–2021).

Similarly, the Management Plans prepared under the 2nd Revision of the River Basin Management Plans of the 14 River Basin Districts of the country, in accordance with Directive 2000/60/EC, refer to the 3d Management Cycle (2022–2027)

The 1<sup>st</sup> revision of the River Basin Management Plan of the Epirus River Basin District was approved by Decision 907/21.12.2017 of the National Water Committee (GG 4664/B/29.12.2017). This revision includes changes in the number and typology of surface water bodies, the addition of new groundwater bodies, changes in the number of artificial and heavily modified water bodies, and a restructuring of the water body coding system, where the prefix “GR” is replaced by “EL”.

It also updates the Register of Protected Areas based on new data and adds new protected areas. The pressures and resulting loads from identified impacts are linked to water bodies in order to optimize the association of measures with them. The revision provides a more complete and reliable depiction of the status of surface water bodies. As a result of the applied methodological approach, water bodies with unknown status have been significantly reduced. The revision also includes an updated assessment of the status of groundwater bodies based on more recent monitoring data.

The 3rd River Basin Management Cycle (2022–2027) for the Epirus River Basin District (EL05) introduces a significant upgrade and tightening of water management policy, but it is not a completely new framework but rather an evolution of the 2nd cycle (2016–2021) under the Water Framework Directive.

The Epirus River Basin District (EL05) includes the River Basin Districts (RBDs) of Aoos (EL0511), Kalamas (EL0512), Acheron (EL0513), Arachthos (EL0514), Corfu–Paxi (EL0534), and Louros (EL0546), as defined under Article 3 of Directive 2000/60/EC and by Decision 706/16.07.2010 (GG 1383/B/02.09.2010 & 1572/B/28.09.2010) of the National Water Committee, regarding the designation of River Basin Districts and the assignment of competent authorities for their management and protection.

The study area falls within the Kalamas River Basin (EL0512), which has an area of 2,523 km<sup>2</sup>. The terrestrial part of the Kalamas basin lies within the Ionian biogeographical region. A significant portion of the Kalamas River Basin is covered by formations of the Ionian Zone. Within the depressions of these basins, Neogene formations (marls, marly limestones, conglomerates, etc.) and Quaternary deposits (alluvial deposits, terrace materials, talus cones and colluvial deposits, as well as coastal formations) have been deposited over the aforementioned geological formations. The most extensive occurrence of these deposits is found in the Ioannina Basin. In the revision of the River Basin Management Plan, as in the original plan, the water systems of the area are classified and their quality is analysed, and the pressures on the aquatic environment are assessed.

In the study area, with regard to the marine zone, it includes the coastal water body “Igoumenitsa Bay” with code EL0512C0003H and an area of 9.15 km<sup>2</sup>. The terrestrial part of the study area does not belong to, nor is it in the immediate vicinity of, any lake, transitional, or river water body.

According to the third revision, the waters of the water body “Igoumenitsa Bay” are classified as having below good ecological status while their chemical status is classified as good,. Overall, the status of the water body is therefore below good. The main groundwater bodies of the Kalamas River Basin are hosted within the

carbonate formations of the Ionian Geotectonic Zone and discharged through concentrated spring outlets. Sinkholes (ponors) draining closed hydrological basins play a crucial role in the recharge of these karst aquifer systems. Secondary aquifers occur within the unconsolidated Quaternary deposits, with their groundwater potential being controlled by grain-size characteristics and recharge conditions. Localized, low-yield aquifers are also developed within the flysch formations, meeting local water-supply, irrigation, and livestock-watering requirements.

In the study area, the Filiatra–Igoumenitsa groundwater body (EL050A070) has been identified, which is characterised by good chemical and good quantitative status.

In addition, general and specific environmental objectives are developed, and a series of measures are set out which constitute the tool for addressing the identified pressures and aim at achieving the environmental objectives of Directive 2000/60/EC.

With regard to the programme of measures, basic measures proposed by the revision apply to the study area, which are related to the implementation of European Union Directives.

Supplementary measure M05Σ0504 is also foreseen for the coastal water body EL0512C0003H. This measure establishes a targeted, high-frequency monitoring programme for surface water bodies under significant pollution pressure, with the purpose of improving knowledge, identifying pollution sources, and supporting the achievement of the Water Framework Directive (2000/60/EC) environmental objectives. It applies to surface water bodies (including coastal and river systems) that are either in “below good chemical status” or are exposed to high pollutant loads relative to their assimilative capacity, as identified through the national Pollutant Register and pressure–impact analysis.

The project does not conflict with the provisions and measures of the 2nd Revision of the River Basin Management Plan.

#### 5.7.4.1.5 Flood Risk Management Plan (FRMP) for the River Basin District of Epirus (EL05)

The Flood Risk Management Plans for River Basin Districts were prepared in implementation of *Directive 2007/60/EC* on the assessment and management of flood risks, with the objective of reducing adverse consequences for human health, the environment, cultural heritage, and economic activities.

This Directive has been incorporated into Greek national legislation through JMD 31822/1542/E103/2010 concerning the “assessment and management of flood risks, in compliance with the provisions of Directive 2007/60/EC on the assessment and management of flood risks of the European Parliament and of the Council of 23 October 2007” (GG 1108/B/21.07.2010), as amended by JMD 177772/924 (GG 2140/B/22.06.2017) and currently in force.

The geographical unit for the implementation of Directive 2007/60/EC on flood risk assessment and management is the River Basin District (Water District), which is the same geographical unit used under Directive 2000/60/EC (the Water Framework Directive).

The Flood Risk Management Plan for the River Basin District of Epirus (EL05), prepared in accordance with the Annex of Directive 2007/60/EC and Article 11 (Annex) of JMD 31822/1542/E103/2010 (GG

1108/B/21.07.2010), was approved by Decision YPEN/GrEGY/41368/326/15.06.2018 of the National Water Committee (GG 2684/B/06.07.2018).

The 1<sup>st</sup> Revision of the Flood Risk Management Plan for the River Basin District of Epirus (EL05) was approved by Decision YPEN/DPDYP/61532/888 (GG 2775/B/05.06.2025) "Approval of the 1st Revision of the Flood Risk Management Plan for the River Basin Districts of the Epirus Water District (EL05) and of the corresponding Strategic Environmental Impact Assessment".

As part of the implementation of the above Directive, the Special Secretariat for Water of the Ministry of Environment and Energy completed the preparation and publication of the revised Flood Hazard Maps and Flood Risk Maps for all Water Districts of the country. The Flood Hazard Maps were prepared for sections of rivers, streams, torrents, and lakes located within the revised Areas of Potentially Significant Flood Risk (APSFRs), which were identified during the revised Preliminary Flood Risk Assessment (Ministry of Environment, Energy and Climate Change – Special Secretariat for Water, 2019). The Flood Risk Maps describe the potential adverse consequences associated with flooding. The revised Flood Hazard and Flood Risk Maps are available on the dedicated website of the Ministry of Environment and Energy:

<https://floods.ypeka.gr/sdkp-lap/maps-2round/>

According to the Flood Risk Management Plan for the River Basin District of Epirus, during the revised Preliminary Flood Risk Assessment (Ministry of Environment, Energy and Climate Change – Special Secretariat for Water, 2019), areas characterized as Areas of Potentially Significant Flood Risk (APSFRs) were identified as presented in the Figure below. The analysis of the characteristics of water bodies and river basins in relation to flood mechanisms was focused on these areas.

**Figure 5-26: Epirus River Basin District (EL05), Areas of Potentially Significant Flood Risk (Source: Revised Preliminary Flood Risk Assessment, October 2019)**

As also shown in Figure 5-26, the study area falls within an Area of Potentially Significant Flood Risk named “Lower Reach – Delta of the Kalamas River and the Coastal Zone of Igoumenitsa”, with code EL05APSR008 and an area of 70,5 km<sup>2</sup>.

Measures such as EL\_05\_31\_02 – Natural Water Retention Measures in Lowland Areas and EL\_05\_33\_02 – Flood Protection Works are proposed in the Flood Risk Management Plan (FRMP) and are related to the construction of flood protection works, necessary to protect areas traversed by watercourses from flooding during severe storm events, given the recent occurrence of flood events in Greece with severe and destructive consequences.

The project does not come into contradiction with the prescribed measures of the revised and relevant Flood Risk Management Plan (FRMP), as its design incorporates, where applicable, the recommended measures of the FRMP. Additionally, it is noted that within the framework of this study, the risk from inland water floods as well as the corresponding risk from the rise of the Mean Sea Level (MSL) are examined and evaluated

(Chapter 11). Specialized measures for prevention, minimization, response, and restoration of impacts are also proposed (Chapter 12), through which the project is safeguarded against potential flood risks.

## 5.7.5 Organized Activity Receptors

According to the Regional Spatial Framework for Epirus (GG 286/AA/28.11.2018), the Regional Unit of Thesprotia was identified as an area with significant development potential in the fields of transport, logistics, tourism, and business activities.

A key objective of the regional planning framework was the strengthening of Thesprotia's role as a gateway for freight transport and transnational connectivity through the development of logistics and transport infrastructure associated with the Port of Igoumenitsa.

In the wider Igoumenitsa area, the most critical organized development receptors are:

- The Port of Igoumenitsa, which constitutes the principal organized transport and logistics hub of the region and one of Greece's most important gateways to Italy and Western Europe. It handles significant volumes of passengers, vehicles, and freight traffic and serves as a key node within the Trans-European Transport Network (TEN-T).
- The tourist marinas of Platara, Syvota, and Sagiada, which function as organized receptors of tourism and recreational boating activities under the management framework of the Port of Igoumenitsa.
- The Thesprotia Industrial/Business Park (BIOPA or Industrial Area of Thesprotia), which serves as the main organized receptor for industrial, manufacturing, and productive activities within the Regional Unit of Thesprotia.
- The organized tourism developments along the coastal zone, particularly in the Syvota–Platara area, where a significant concentration of tourism facilities and accommodation establishments is located.

In this context, the existing Business Park (BIO.PA.) at "Gkiata" in the Municipal Unit of Paramythia was recognized as an organized receptor of productive activities with considerable potential for further development due to its low occupancy levels. In addition, the establishment of the proposed Kastri Business Park in the Municipal Unit of Igoumenitsa was promoted, aiming to capitalize on its strategic location in proximity to the Port of Igoumenitsa and the Greek–Albanian border zone.

Regarding tourism development, the Regional Spatial Framework identified the Ionian Coastal Front as a priority tourism development zone. Within Thesprotia, the settlements of Platara, Syvota, and Perdika were recognized as important tourism poles supporting organized tourism activities. Regional policy promotes the upgrading of tourism infrastructure, the enhancement of thematic and alternative tourism, and the development of complementary tourism networks linked to cultural, natural, and recreational resources.

The framework further supported the development of marine tourism infrastructure along the Ionian coastline. Proposed projects included the establishment of a marina in the Igoumenitsa area and additional yachting facilities in the wider Syvota–Perdika coastal zone. The ports of Igoumenitsa and Preveza were also identified as potential support infrastructure for cruise tourism development.

**Figure 5-27: Spatial organization of tourism activity at the Ionian coastal front: Igoumenitsa-Plataria-Syvota-Parga**  
(Source: Map P.2.a of the Regional Spatial Framework of the Region of Epirus, 2018).

According to the Regional Spatial Framework for Epirus, key planning directions include the designation of landscape protection zones, the restriction of dispersed development, the promotion of organized development receptors, and the enhancement of environmental infrastructure and awareness.

A fundamental planning objective is the concentration of productive activities within designated and organized development receptors. The Framework prioritizes the establishment and expansion of industrial and business parks and discourages the scattered location of new productive facilities outside organized areas through stricter land-use controls. This direction is directly relevant to the Thesprotia Industrial/Business Park (BIOPA/BIPE), which is identified as the principal organized receptor for industrial and manufacturing activities within the Regional Unit of Thesprotia.

The Framework also promotes stricter control of out-of-plan development, particularly within the coastal zone, to protect landscape resources and prevent uncontrolled urban expansion. This policy is especially relevant to the organized tourism development areas of the Syvota-Plataria coastal zone, where future tourism growth is expected to focus on the qualitative upgrading of existing facilities rather than extensive spatial expansion.

For the coastal landscape zones of Parga-Perdika-Syvota, the Regional Spatial Framework promotes the enhancement of tourism services while ensuring that development remains compatible with the carrying capacity of local environmental resources. The planning approach emphasizes sustainable tourism, landscape conservation, and the protection of sensitive ecosystems. These directions directly support the continued development of the organized tourism areas of Syvota and Plataria, as well as the associated tourist marinas, which constitute key tourism infrastructure within the region.

The Framework further recognizes the importance of marine tourism and coastal recreation infrastructure. In this context, the tourist marinas of Plataria, Syvota, and Sagiada contribute to the diversification and

upgrading of the regional tourism product while supporting nautical tourism and recreational boating activities along the Ionian coast.

Special emphasis is also placed on environmental protection measures aimed at reducing pollutant loads from agricultural and industrial sources. For the Kalamas Delta–Sagiada Coastal Zone, the Framework requires actions to significantly reduce pollution entering the water bodies of the Kalamas River. These directions are particularly relevant to the coastal and port-related activities of the wider Igoumenitsa area, including the Port of Igoumenitsa, the Sagiada marina, and adjacent productive activities whose environmental management must be compatible with the protection objectives of the Kalamas estuarine and coastal ecosystems.

## 6 Detailed description of the Project

### 6.1 Basic Project Elements

Energean Hellas Ltd (Operator), together with its partners ExxonMobil Exploration and Production Greece (Crete) B.V. and HelleniQ Upstream West Kerkyra S.A., proposes to drill a single offshore exploration well, named Asopus 1, in Block 2 of the Ionian Sea, offshore western Greece, in 2027. This would be the first offshore exploration well to be drilled in western Greece since 1981.

The objective of the proposed activity is to evaluate subsurface geological formations and assess the potential presence of hydrocarbons. The well will be drilled using a mobile offshore drilling unit (MODU), specifically the Stena DrillMAX drillship, which is designed specifically for deepwater drilling operations.

The proposed activity is temporary and limited in scope, comprising the drilling, evaluation, and subsequent plugging and abandonment of the exploration well. The Project does not include hydrocarbon production, well testing, flowback or flaring activities. If hydrocarbons are identified, any further appraisal or development activities would be subject to separate permitting and environmental assessment processes.

The offshore operation will be supported by routine marine and aviation logistics, including helicopter operations from Corfu Airport and PSVs operating along established navigation routes between the MODU and an existing onshore supply base at the port of Igoumenitsa. These support activities do not require new construction or modification of coastal or onshore infrastructure.

#### 6.1.1 Offshore Exploration Well

The proposed Asopus 1 well is a single offshore exploration well designed to evaluate subsurface geological formations in Block 2. The well will be drilled from the MODU through the seabed to the target formations and will be used solely for exploration and data acquisition purposes. Well construction and abandonment will be carried out in accordance with established offshore practices, to ensure well integrity and prevent unplanned releases to the marine environment.

The well will be constructed in a series of progressively smaller hole sections, each secured with steel casing and cemented in place as drilling progresses. This staged well construction approach is standard offshore practice and is designed to maintain well integrity, manage formation pressures, and protect the surrounding marine environment. The well is currently planned as a vertical exploration well.

Drilling will commence at the seabed and proceed to the planned final depth. Drilling fluids will be used to stabilise the wellbore, transport drill cuttings to the surface, and control subsurface pressures. The types of drilling fluids, handling of cuttings, and cementing operations are described in subsequent sections of this Chapter.

Following conclusion of drilling and formation evaluation, the well will be plugged and abandoned in accordance with applicable regulatory requirements and recognised offshore industry practice.

The final well design, including casing depths and drilling parameters, will be confirmed before drilling and submitted to the competent authority as part of the Notification of Well Operations (NoWO).

## 6.1.2 Onshore Infrastructure

The offshore operation will be supported by routine marine and aviation logistics, including helicopter operations from Corfu International Airport (CFU) and PSV services along established navigation routes between the MODU and an existing onshore supply base at the port of Igoumenitsa. These support activities do not require new construction or modification of coastal or onshore infrastructure. Project-specific temporary facilities will be located within existing port and airport areas.

The supply base will function solely as a logistics interface between onshore services and offshore operations. It will be used for the storage, staging, and loading or unloading of equipment, materials, consumables, and wastes associated with the Asopus-1 drilling campaign. The location of the supply base and associated vessel routes is consistent with the Project's operational area and logistics framework.

Supply base activities will be conducted in accordance with existing port operating procedures and applicable health, safety, and environmental requirements. Its use does not require the construction of new infrastructure, expansion or modification of existing port facilities, or dredging or other seabed works within the harbour area. No liquid mud plant (LMP), bulk chemical mixing plant, or other project-specific drilling fluids processing facilities will be installed at the Port of Igoumenitsa for the proposed exploration activities.

The Port of Igoumenitsa is owned and operated by a third party (ΟΛΗΓ ΑΕ) and functions as an established commercial port, under a valid and consolidated environmental permitting and planning framework. The original Environmental Terms were issued through JMD 144974/08.06.2005 for the construction and operation of Phase B of the New Port and subsequently amended by JMD 139663/18.05.2009 to incorporate the Phase C expansion works. A further amendment was issued in 2013 to authorise the establishment and operation of a temporary construction site, including a concrete batching plant and associated ancillary facilities. The environmental permit currently in force is Decision ΥΠΕΝ/ΔΙΠΑ/12891/794/17.03.2022, which updated the applicable environmental conditions and extended the validity of the Environmental Terms until 25 September 2035. The port's spatial development and future operation are also governed by the updated Port Masterplan, approved through Ministerial Decision 8216/126/2014.

Helicopters will support offshore exploration drilling by transferring personnel between the MODU and CFU. A dedicated temporary helicopter hangar will be established within the existing airport area to support routine helicopter staging. Sufficient space is available, and installation of the hangar will not require expansion beyond the existing airport footprint. The temporary helicopter hangar will be located within the existing airport operational footprint and is not expected to require expansion of airport infrastructure or alteration of the airport's operational role.

Helicopter operations will use existing airport infrastructure and established flight procedures and will be limited to the duration of the Asopus 1 exploration drilling activity. The helicopter operator will determine flight routing and scheduling in accordance with aviation safety requirements and prevailing operational conditions. Helicopters may also be used for emergency response purposes, including medical evacuation, if required. Figure 6-1 overleaf, illustrates a typical offshore helicopter that may support the Project.

Figure 6-1: Typical offshore helicopter

### 6.1.3 Design Envelope

The design envelope defines the maximum spatial extent, duration, and scale of activities assessed in this Environmental and Social Impact Assessment (ESIA). It represents the outer bounds within which the proposed exploration drilling activity may occur, allowing for operational flexibility while ensuring that all potential environmental and social effects are assessed conservatively. The design envelope does not represent the expected extent of impacts, but rather the maximum limits assessed to ensure conservative evaluation.

Table 6-1 summarises environmentally relevant information for drilling operations, including formation evaluation, to facilitate a conservative assessment of impacts and risks.

Table 6-1: Environmentally relevant details for drilling operations

| PARAMETER                                         | DETAILS                                                                                                  | ENVIRONMENTALLY RELEVANT INFORMATION                                                                                                                                         |
|---------------------------------------------------|----------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Exclusion zone                                    | 500 m radius of the rig's safety zone                                                                    | Refers to the area surrounding the drilling location where other marine users will be displaced.                                                                             |
| Total Crew Accommodation                          | MODU: typically 160, up to 180 persons-on-board (POB).<br>Support vessels: 12-18 POB                     | Informs on the volumes of sewage, greywater, brine and putrescible (e.g. food) waste generated.                                                                              |
| Endurance at Sea                                  | Varies depending on equipment and materials, including bulk transfers of chemicals, wastes and supplies. | Informs where activities may take place:<br>- Resupply of the rig will occur within the operational area.<br>- Refuelling of the rig will occur within the operational area. |
| Supply vessel major fuel tank loss of containment | 350 m <sup>3</sup> light fuel                                                                            | Informs of a credible worst-case oil spill risk in the event of a vessel collision.                                                                                          |
| Fuel Type                                         | Marine gas oil                                                                                           |                                                                                                                                                                              |
| Rig Operations                                    | Source levels from vibrating equipment and drilling                                                      | Informs expected non-impulsive sound levels during specific activities.                                                                                                      |
| Rig vessel propulsion                             | Source levels from and dynamic positioning always operating.                                             |                                                                                                                                                                              |

| PARAMETER                              | DETAILS                                                                                                                   | ENVIRONMENTALLY RELEVANT INFORMATION                                                                                                               |
|----------------------------------------|---------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| Supply vessel propulsion               | Source levels from main engines always operating and from dynamic positioning during specific activities, e.g., resupply. |                                                                                                                                                    |
| Propulsion and Power – Equipment Types | Main engines, generators and thrusters                                                                                    | Result in the discharge of cooling water and the generation of oily bilge water and inform the potential for water quality and associated impacts. |
| Lighting for Navigation and Safe Work  | Minimum required for safe operations                                                                                      | Informs of the potential for lighting impacts.                                                                                                     |
| Well Testing / Flowback / Flaring      | Not included within the scope of the Project                                                                              | Informs emissions to the atmosphere and light emissions                                                                                            |
| Well Evaluation Techniques             | Vertical Seismic Profiling (representing the evaluation technique with the loudest sound source)                          | Informs a worst-case credible impulsive sound level during well evaluation over a maximum 12-hour survey duration each on up to two well sections. |

The design envelope has been developed based on the current stage of project design and reflects the maximum foreseeable parameters of the exploration drilling programme. The parameters applied to each impact assessment are identified in the relevant assessment section.

Table 6-2 summarises the design envelope for the proposed Asopus 1 exploration drilling activity, including the anticipated timeframe, maximum activity duration, number of wells assessed, and the maximum spatial extent of operations.

**Table 6-2: Design Envelope**

| PARAMETER                                                                                | EXPLORATION DRILLING                                                                                                                           |
|------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| Earliest Start Date                                                                      | 14 February 2027                                                                                                                               |
| Latest Finish Date                                                                       | 31 December 2027                                                                                                                               |
| Maximum number of wells                                                                  | 1 well                                                                                                                                         |
| Maximum spatial extent within which the activity can occur for the exploration programme | 0.79 km <sup>2</sup> with a 500 m rig exclusion zone. For reference, the Block 2 Lease Agreement includes a surface of 2,422.1 km <sup>2</sup> |
| Expected Duration                                                                        | 57-67 days. Maximum assessed duration: 90 days                                                                                                 |

The dates above define the potential operational window within which drilling may commence and be completed. The offshore campaign is expected to last approximately 57 days for a dry well or 67 days if hydrocarbons are encountered. The 90-day duration represents the outer scheduling envelope for delays and operational contingencies. Unless otherwise stated, quantified activity, discharge, waste and emissions estimates are based on the 67-day operating case and the separately quantified contingency scenarios. Any extension involving additional active drilling, logistics movements or discharges beyond the assessed quantities will be reviewed through the applicable change-management and regulatory processes.

Based on the current design, the permanent physical footprint on the seabed associated with the exploration activity is expected to be less than 1 m<sup>2</sup>. The wellhead will be left in-situ as part of the permanent plug and abandonment. Retention of the wellhead forms part of the approved abandonment concept assessed for the Project and avoids additional seabed intervention associated with recovery activities.

No additional facilities, subsea structures, pipes or processing infrastructure will be installed nor remain on the seabed following completion of the Project. Any material changes to the proposed activity that would extend beyond the parameters assessed in this ESIA may be subject to the applicable regulatory requirements.

## 6.2 Project Location

The proposed Asopus-1 exploration well is located within the Block 2 licence area in the Greek Exclusive Economic Zone (EEZ) in the northwestern Ionian Sea. It is approximately 44.3 km (23.9 nautical miles) offshore Othonoi Island (Figure 1 2), approximately 3.2 km (1.7 nautical miles) from the Italian Exclusive Economic Zone (EEZ) and in water depths of approximately 840 m.

The deep-water setting means drilling activities will occur well offshore, at a substantial distance from coastal receptors. There are no islands, coastal features, or fixed subsea installations in the immediate vicinity of the well location.

The location of the proposed Asopus 1 exploration well (Section 1.3.1.1) was selected based on technical and operational considerations, including MODU capability, well design requirements, and logistical feasibility within the Block 2 licence area.

During drilling operations, a temporary 500 m safety zone (Section 1.3.1.2) will be established around the MODU at the Asopus-1 well location to ensure navigational safety and safe conduct of offshore operations. This safety zone covers approximately 0.79 km<sup>2</sup> and will apply only during drilling operations while the MODU is on location. Once drilling is completed and the MODU has departed the site, the safety zone will be removed, and normal maritime activities may resume.

The Project will also utilise two existing onshore support facilities (Section 1.3.1.4) for logistics and aviation activities:

- (i) Onshore logistics/supply base located within the Port of Igoumenitsa (mainland Greece); and
- (ii) Corfu International Airport (CFU), which will be used as the helicopter operations base for personnel transfers between the onshore environment and the Mobile Offshore Drilling Unit (MODU).

The existing transport and logistics facilities will remain operational within their current permitted boundaries throughout the Project.

## 6.3 Operations time schedule

The indicative Project schedule for the Asopus-1 exploration drilling programme is presented in Figure 6-2. The schedule covers the main stages of the Project, including preparation, offshore drilling operations, plugging and abandonment, and demobilisation.

Preparation activities, including well planning, regulatory approvals and logistics arrangements, are expected to take place before rig mobilisation. Offshore operations will commence following rig arrival at the well location, with drilling expected to last approximately 57 days for the dry-well case or 67 days if hydrocarbons are encountered, including formation evaluation and permanent plugging and abandonment. Demobilisation and regulatory reporting will continue after completion of offshore activities. The schedule is indicative and

may be adjusted depending on regulatory approvals, rig availability, operational requirements, weather conditions and final execution of the drilling programme.

The final activity schedule will be confirmed as part of the Notification of Well Operations (NoWO) submitted to the competent authority before drilling.

**Figure 6-2: Operations time schedule**

**Note:** Indicative schedule only; timing remains subject to permits, operational constraints, vessel availability and final execution readiness.

### 6.3.1 Drilling Preparation and Mobilisation

---

The Asopus-1 exploration drilling campaign is planned to take place in 2027, with a start window in the first quarter of 2027 (Q1 2027), subject to regulatory approvals, contractor availability, and project readiness. Subject to operational, contractor and regulatory constraints, drilling is anticipated to commence outside the peak tourism season where practicable.

### 6.3.2 Drilling Operations

---

Once the MODU arrives at the operational area, drilling and associated activities will be carried out continuously, 24 hours per day, 7 days per week, to ensure safe and efficient operations. The MODU will remain on location only for the period required to complete drilling, formation evaluation, and plugging and abandonment of the well, as applicable.

The expected duration of the offshore campaign is approximately 57 days for a dry well or 67 days if hydrocarbons are encountered. For environmental assessment purposes, the design envelope allows a maximum duration of 90 days to account for potential unplanned delays such as adverse weather conditions or operational contingencies.

The references to 2027 presented in the design envelope represent the available operational window and should not be interpreted as the anticipated duration of drilling activities.

### 6.3.3 Abandonment – Demobilisation

---

All offshore activities will cease once the exploration programme is concluded and the MODU departs the site. The abandoned wellhead will remain in situ on the seabed in accordance with recognised offshore industry practices, applicable regulatory requirements, and the final abandonment programme.

## 6.4 Detailed description of Facilities

---

### 6.4.1 Mobile Offshore Drilling Unit (MODU)

---

The proposed Asopus 1 exploration well will be drilled using a drillship-type mobile offshore drilling unit (MODU). A drillship is a self-propelled vessel designed specifically for deep water offshore drilling, equipped with a drilling package and a moonpool that allows drilling equipment to be deployed directly through the hull to the seabed.

#### 6.4.1.1 Drillship Specifications

---

Project description is based on the Stena DrillMAX drillship, or a technically equivalent dynamically positioned drillship of comparable capability. The Stena DrillMAX is owned and operated by Stena Drilling and will be contracted by Energean for the exploration drilling programme (Figure 6-3). The vessel is a sixth-generation

drillship designed for operations in harsh offshore environments and is equipped with a dynamic positioning (DP3) system to maintain station without anchors. It can drill in water depths of up to 3,000 m, which exceeds the water depth at the proposed Asopus 1 well location. The use of a dynamically positioned drillship avoids the need for anchor deployment and associated seabed disturbance.

(Source: Stena Drilling Website)

Figure 6-3: Stena DrillMAX

Before operations commence, the drillship will be covered by a Report of Major Hazards (RoMH), accepted by HEREMA. It will undergo Energean's internal rig acceptance and assurance process to confirm compliance with applicable regulatory requirements and good international industry practice.

Key specifications of the drillship are summarised in Table 6-3.

Table 6-3: Drillship specifications based on the Stena DrillMAX<sup>44</sup>

| COMPONENT               | SPECIFICATION                                                                                                  |
|-------------------------|----------------------------------------------------------------------------------------------------------------|
| Dimensions              | 228 m (long) x 42 m (wide) x 19 m (moulded depth)                                                              |
| Drafts                  | 12 m operating / 8.5 m transit                                                                                 |
| Variable Deck Operating | 19,500 Mt at 12 m                                                                                              |
| Transit Speed           | Up to 12 knots                                                                                                 |
| Maximum water depth     | 3,000 m                                                                                                        |

#### 6.4.1.2 Drilling Mud Systems

The MODU is equipped with an integrated drilling fluid (mud) system comprising separate active and reserve mud systems to support both routine and contingency drilling operations. Water-based mud (WBM) will be used throughout the project. Drilling fluids are used to maintain well pressure, stabilise the wellbore, cool and lubricate the drill bit, and transport drill cuttings to the surface.

The system includes bulk storage facilities for barite and cement. The combined usable storage capacities are approximately 420 m<sup>3</sup> for barite/bentonite and 420 m<sup>3</sup> for cement. Bulk materials are transferred pneumatically from supply vessels to the storage tanks and then automatically conveyed to surge tanks and mud mixing units. The mud mixing system includes automated sack handling and chemical dosing equipment, high-rate mixers, caustic mixing units and dust collection systems designed to minimise airborne particulate releases during material handling.

Tank details are shown in Table 6-4 below:

**Table 6-4: Bulk Storage Tank Details**

| TANK                 | NUMBER | COMBINED TANK CAPACITY M <sup>3</sup> |
|----------------------|--------|---------------------------------------|
| Barite Storage Tanks | 4      | 420                                   |
| Cement Storage       | 4      | 420                                   |
| Barite Surge Tanks   | 2      | 10                                    |
| Cement Surge Tank    | 1      | 2.16                                  |

Drill water is used primarily to prepare drilling fluids and cement during drilling operations. The MODU is equipped with two dedicated drill water storage tanks, located on the port and starboard sides of the vessel, with a combined storage capacity of approximately 4,464 m<sup>3</sup>. Drill-water storage tanks may receive seawater or freshwater produced onboard, depending on the requirements of the relevant drilling-fluid, cementing or technical operation and distributed via service pumps to the mud pits, cementing unit, shale shakers, centrifuges and other operational systems, as required. Tank filling operations are automatically monitored and controlled to prevent overfilling.

A series of active and reserve mud pits are used for the storage, circulation and management of drilling fluids during operations. The mud pits are located within the mud module and in dedicated port and starboard hull tanks below it. The active mud pits have a combined capacity of approximately 1,004 m<sup>3</sup>, while reserve mud pits provide an additional 1,005 m<sup>3</sup> of storage capacity to support contingency operations and maintain sufficient drilling fluid reserves.

Additional tanks are provided for chemical additives, slugging operations and waste mud storage, including a dedicated waste mud tank with a capacity of approximately 500 m<sup>3</sup>. The mud pits form part of the closed-loop mud circulation system, allowing drilling fluids returning from the well to be processed, conditioned and recirculated through the mud treatment equipment before reuse.

Mud circulation is maintained using high-pressure mud pumps, which pump drilling fluids through the drill string and return fluids and cuttings to the surface for treatment. Returned mud passes through a mud treatment and recovery system comprising shale shakers, desilters, centrifuges, degassers and associated treatment tanks. This equipment separates drill cuttings and entrained gas from the drilling fluid, allowing treated mud to be recirculated and reused where practicable, thereby reducing overall mud consumption and waste generation.

#### 6.4.1.3 Managed Pressure Drilling (MPD) System

---

The MODU is equipped to undertake Managed Pressure Drilling (MPD) if required during drilling operations. MPD is not anticipated to be used routinely but is available as a contingency measure where drilling conditions indicate a need for enhanced wellbore pressure management.

MPD enables more precise control of annular pressure within the wellbore than conventional drilling methods alone can. The system may be used where there is uncertainty in the pressure regime or where a narrow operational margin exists between pore pressure, fracture pressure and drilling fluid density requirements.

The use of MPD can help minimise downhole fluid losses to the formation, reducing the likelihood of formation damage, loss-circulation events and associated remedial operations. It can also help with the early identification and management of pressure-related drilling hazards, supporting well integrity and safe drilling operations.

Where deployed, MPD forms part of the MODU's integrated drilling and well-control systems and does not introduce any additional routine emissions, discharges, waste streams or seabed disturbance beyond those already assessed for the Project.

#### 6.4.1.4 Cementing Unit

---

The cementing unit is located within the mud module of the MODU and is operated by a third-party cementing contractor. The unit is used to prepare, mix, and pump cement slurry and associated fluids for well construction and well integrity operations.

The system comprises two diesel-driven high-pressure pumps (rated up to 15,000 psi, with one unit configured to 10,000 psi), cement storage tanks, a surge tank, and an integrated chemical mixing system. The pumps provide the required pressure and flow capacity for high-pressure fluid transfer during offshore cementing operations.

The primary purpose of the cementing unit is to support casing cementing operations, ensuring zonal isolation and the well's long-term structural integrity. In addition, the unit is used for pressure testing,

including well barriers, Blowout Preventer (BOP), choke and kill lines, and associated riser systems. It can also be deployed as part of well-control operations, including well-kill circulation, where required.

#### 6.4.1.5 Well Control Equipment

Well control is provided through a combination of equipment designed to prevent uncontrolled release of formation fluids and to enable safe management of the well under both normal and emergency conditions. Primary well control is provided by the drilling mud system, which maintains hydrostatic pressure in the wellbore to balance formation pressures and prevent influx. Mud pumps, riser circulation, and mud treatment equipment support continuous circulation and conditioning of the drilling fluid.

Secondary well control is provided by the Blowout Preventer (BOP) system, which forms the primary mechanical barrier to seal the well in the event of a loss of mud control or a “kick”. The BOP stack includes annular preventers and ram preventers (including blind-shear and variable-bore rams) that can close around the drill string or shear it, sealing the wellbore. The system is controlled via a subsea electro-hydraulic multiplex (MUX) control system and supported by independent emergency activation systems (including automatic shutdown, ROV intervention, and acoustic control) to ensure well closure under failure conditions.

Well control and pressure management are supported by the choke-and-kill system and the marine riser. The choke and kill lines provide controlled pathways to circulate out influxes and manage well pressure during well kill operations. Returned fluids are routed to the mud gas separator (MGS), where gas is safely separated and vented, while liquids are returned to the mud system for processing and reuse where appropriate. The riser provides the physical conduit between the subsea wellhead and the drilling unit and integrates these circulation and control lines.

A diverter is installed at the top of the marine riser to protect personnel and the rig floor. Gas is normally avoided through early detection and secondary well control practices, with the diverter reserved as a last resort in the unlikely event that gas reaches the rig floor despite these measures. This system rapidly redirects flowing well fluids away from the vessel via dedicated overboard lines until the BOP can be closed.

In addition to the primary BOP, a further emergency shut-in device (E-SID) shall be installed on the wellhead prior to running and latching the BOP – see Figure 6-4. The device, known as the Kinetic Blowout Stopper (K-BOS), comprises a single ram that can shear tubulars/cable within the Project’s defined shearing envelope, and seal the wellbore. The E-SID remains passive during normal operations and serves as an additional well-control barrier layer that can be activated in the unlikely event of BOP system failure.

The electrically initiated, pyro-mechanical K-BOS E-SID control system is completely independent of the MODU BOP control system, including its power supply, communications, and actuation circuits. This independence ensures that the K-BOS E-SID can be activated even in the unlikely scenario where the primary BOP control system is unavailable or inoperable. Upon activation, the K-BOS is designed to rapidly shear and seal the wellbore, providing an additional layer of emergency well control and reducing the risk of an uncontrolled release of formation fluids.

Together, these systems provide layered well control capability: hydrostatic control via drilling mud, mechanical sealing via the BOP, controlled circulation via choke and kill equipment, and emergency fluid diversion via the diverter system.

Figure 6-4: Emergency Shut-in Device

#### 6.4.1.6 Wastewater Management Systems

##### 6.4.1.6.1 Ballast Water System

The drilling unit is equipped with an integrated ballast water system designed to maintain vessel stability, trim and draft during transit, drilling operations and adverse weather conditions. The system enables controlled transfer of seawater between dedicated ballast tanks to ensure compliance with stability requirements and safe operating conditions throughout all phases of the drilling campaign.

The ballast system comprises two main ballast pumps, each with a nominal capacity of approximately 2,500 m<sup>3</sup>/h, associated ballast piping, remotely operated valves and a network of ballast tanks distributed throughout the vessel. The system is controlled through the vessel's Integrated Automation System (IAS), allowing ballast operations to be monitored and managed from the bridge or engine control room. Additional ballast, bilge and general service pumps are provided to serve specific tanks and compartments and to support emergency dewatering requirements.

Ballast water is taken on board and discharged as required to maintain vessel stability. During normal operations, ballast is treated in accordance with the vessel's Ballast Water Management Plan and applicable international maritime regulations, including the requirements of the International Convention for the Control

and Management of Ships' Ballast Water and Sediments (BWM Convention). Ballast-water exchange may be undertaken as a contingency, where permitted under the approved Ballast Water Management Plan and applicable requirements.

To minimise the risk of introducing non-native aquatic species and pathogens, the drilling unit is fitted with a Ballast Water Management System (BWMS) comprising mechanical filtration and ultraviolet (UV) disinfection. During ballast uptake, seawater passes through a filtration unit that removes suspended solids, sediments and larger organisms before entering the ballast tanks. During both ballasting and de-ballasting operations, the water passes through a UV treatment reactor where microorganisms are exposed to ultraviolet light, preventing reproduction and reducing the risk of biological transfer between marine environments.

The treatment process does not involve the addition of chemicals and therefore does not generate chemical residuals or treatment by-products requiring discharge management. Operational parameters and treatment records are automatically logged and maintained in accordance with regulatory requirements. Any system malfunction or operational deviation is recorded in the Ballast Water Record Book and managed in accordance with vessel procedures.

Ballast water discharges will consist solely of treated seawater and will be undertaken in accordance with applicable international and national requirements. Consequently, the potential for adverse environmental effects associated with ballast water operations is considered low.

#### 6.4.1.6.2 Bilge Water System

The drilling unit is equipped with a comprehensive bilge water collection and management system designed to collect, contain, monitor and treat water accumulating within machinery spaces and other enclosed compartments. The system forms an important component of the vessel's pollution prevention arrangements and is designed to prevent the uncontrolled discharge of oily water to the marine environment.

Bilge water may originate from routine machinery operations, equipment drainage, minor leaks, washdown activities, condensation and emergency dewatering operations. Bilge wells and collection points are distributed throughout engine rooms, thruster rooms, machinery spaces and other technical compartments. These collection points are fitted with level-monitoring systems and alarms that provide automatic indication of elevated bilge levels and facilitate timely removal of accumulated fluids.

Collected bilge water is transferred to dedicated bilge holding tanks where it is temporarily stored before treatment (Table 6-5). The vessel is equipped with an oily water separation system that separates oil from water before discharge or disposal. Recovered oil is transferred to dedicated waste oil storage tanks for subsequent offloading to licensed waste reception facilities, while treated water may only be discharged when it complies with the applicable MARPOL requirements and the operational limits of the oily water separator. Where discharge criteria cannot be met, bilge water will be retained onboard for transfer to approved port reception facilities.

The bilge system also incorporates emergency pumping arrangements to respond to flooding incidents in machinery spaces. Additional pumps are provided in engine rooms, thruster compartments and auxiliary machinery spaces to maintain the vessel's safety and watertight integrity under abnormal conditions.

Bilge water management will be undertaken in accordance with the vessel's environmental management procedures, MARPOL Annex I requirements and applicable flag-state and classification society requirements. Using dedicated collection systems, treatment equipment, monitoring arrangements and controlled disposal procedures, the risk of hydrocarbon releases to the marine environment is minimised, and residual environmental impacts are expected to be negligible.

### 6.4.1.6.3 Drainage System

The vessel is equipped with a segregated drainage system designed to collect and control liquids from exposed decks, machinery spaces and drilling-related areas. Drainage is collected via scuppers, deck drains and dedicated piping networks and routed by gravity to a series of intermediate and main drain tanks located throughout the vessel.

Key drainage tanks include the Topside Drain Tank (985 m<sup>3</sup>), serving the drill floor and well test areas; the Deck Drain Tank (985 m<sup>3</sup>), for safe areas and riser storage; and the Mud Module Drain Tank (96 m<sup>3</sup>), supported by smaller daily and machinery-space holding tanks. All tanks are fitted with level sensors and high/low alarms integrated into the vessel's Shipboard Vessel Control (SVC) system.

The main drainage and bilge collection tanks are summarised in Table 6-5.

**Table 6-5: Drainage and bilge collection tanks**

| TANK                                                                | INDICATIVE CAPACITY (M <sup>3</sup> ) |
|---------------------------------------------------------------------|---------------------------------------|
| Topside Drain Tank (Drill Floor and Well Test Areas <sup>46</sup> ) | 985                                   |
| Daily Holding Tank                                                  | 9.4                                   |
| Deck Drain Tank (Safe Areas and Riser Storage Areas)                | 985                                   |
| Mud Module Drain Holding Tank                                       | 96                                    |
| Forward Bilge Holding Tank                                          | 21.9                                  |
| Aft Bilge Holding Tank                                              | 54.5                                  |
| Separated Bilge Oil Tank                                            | 13.6                                  |

Deck drainage is managed according to its source and potential for contamination. Drainage from uncontaminated areas may be discharged via the designated drainage system, whereas potentially oil-contaminated drainage is diverted to dedicated holding or treatment systems. Oily water is discharged only if it meets the applicable MARPOL Annex I requirements, including the 15 ppm oil-content limit where applicable; otherwise, it is retained for further treatment or transferred ashore.

### 6.4.1.6.4 Sanitary and Greywater System

Domestic wastewater generated onboard comprises blackwater (sewage) from sanitary facilities and greywater from accommodation, galley, laundry, and washroom facilities. These wastewater streams are

<sup>46</sup> The reference to "Well Test Areas" reflects the original vessel design terminology and does not imply that well testing forms part of the proposed activity.

managed through dedicated collection and treatment systems designed to meet applicable MARPOL Annex IV requirements and other relevant regulatory standards.

Sewage is processed through an onboard treatment plant that incorporates maceration and biological treatment processes before discharge. Treated effluent is discharged only where permitted by applicable regulations and operational procedures. Within restricted areas and where required by local regulations, untreated sewage is retained onboard in dedicated holding tanks and discharged only when regulatory conditions permit.

Greywater is directed to the final stage of the sewage treatment system, where it undergoes further treatment and disinfection before discharge. Disinfection is achieved through controlled dosing of chlorine-based solutions, which are consumed during treatment. A sampling point is provided for treated effluent. Treated effluent quality is monitored through routine inspection and operational checks undertaken by vessel personnel as part of the vessel's environmental management procedures.

#### 6.4.2 Platform Support Vessels (PSVs)

---

Offshore exploration drilling operations will be supported by PSVs operating between the onshore supply base at Igoumenitsa and the MODU at the Asopus 1 well location. These vessels provide essential logistical and safety support throughout the drilling campaign. Support vessel activities will be limited to the duration of the offshore exploration drilling campaign.

While operating within the operational area, support vessels will either remain stationary or operate at low speeds, as appropriate to operational requirements. Their primary functions include:

- Providing safety-related support, including assistance with monitoring the 500 m safety zone around the MODU;
- Transporting equipment, drilling materials, provisions, fuel, water and limited waste between the MODU and the onshore supply base; and
- Supporting project-related inspection, survey, and verification activities before and after drilling operations, if applicable.

All support vessels will be contracted from third-party service providers and will meet Energean's marine vetting and assurance requirements. Their activities will be confined to established offshore supply routes and the immediate vicinity of the MODU.

Two PSVs may be operating in support of drilling activities at any one time. Vessels will hold the necessary class and statutory certification and operate under valid Hellenic Coast Guard permits, in compliance with applicable international maritime safety and environmental protection requirements, including IMO and MARPOL conventions.

(Source: Tidewater Website)

**Figure 6-5: Indicative Platform Supply Vessels**

Figure 6-5 shows an indicative platform supply vessel of a type that may support the Project. Final vessel selection will depend on contractor availability and operational requirements. The selected vessels will remain within the technical and environmental parameters assessed in this ESIA.

The indicative vessel features DP-2 dynamic positioning, a large open cargo deck, accommodation for the vessel crew and project personnel required for its assigned activities and tanks for fuel, water, liquid mud, methanol, and dry bulk materials. The vessel is equipped with twin Z-drives, bow thrusters, and features to manage energy efficiently.

Indicative vessel characteristics include:

- Length overall: ~89 m
- Beam: ~ 19 m
- FiFi-1 firefighting capability
- Diesel-electric propulsion
- DP-2 dynamic positioning system with multiple reference systems.

### 6.4.3 Remotely Operated Vehicle (ROV)

A Remotely Operated Vehicle (ROV) is an unoccupied, manoeuvrable underwater vehicle. The Project ROV will be deployed and operated from the MODU using a tether and umbilical system for power, control and data transmission. ROV operations will be conducted intermittently throughout the drilling campaign to support offshore activities. The ROV will be used for seabed inspection before drilling, inspection and monitoring of subsea equipment such as the riser and blowout preventer (BOP), support during well plug-and-abandonment and a post-operation survey to verify seabed clearance and the absence of debris before the rig release.

ROV operations are localised to the immediate vicinity of the well location. Activities may involve temporarily wet-parking the ROV on the seabed. Any interaction with the seabed is expected to be minor, short-term, and spatially confined, resulting in no significant or lasting alteration of seabed conditions. ROV activities will be conducted in accordance with applicable Environmental Terms and with the general obligations of the Barcelona Convention Offshore Protocol to prevent pollution and minimise impacts on the marine environment.

## 6.4.4 Support infrastructure

The offshore exploration drilling activity will be supported by a combination of marine and aviation logistics, together with the use of an existing onshore supply base. These supporting components are required to transport personnel, equipment, consumables, and wastes to and from the MODU and to support routine resupply during the drilling campaign.

The supply vessels and helicopters supporting the Project will be contracted temporarily from third-party service providers for the duration of the exploration drilling activity. Project-specific support facilities will be located within existing port and airport areas. No new permanent onshore or offshore infrastructure is required to support the proposed activities.

### 6.4.4.1 Logistics base

The onshore temporary logistics base at Igoumenitsa Port will function as a storage, staging, and load-out area for equipment and materials required during the drilling programme. Activities will include the receipt, temporary storage, handling, and consolidation of drilling equipment, tubulars, consumables, and support materials before loading onto offshore supply vessels for transport to the drilling rig. The base will also manage backload operations, receiving equipment, waste streams, and empty containers returning from the rig for temporary storage, inspection, and onward transport to approved facilities.

The temporary base will provide a reliable and well-organised onshore logistics chain, minimising offshore downtime and supporting the safe and efficient transfer of materials between the port and the drilling installation.

Use of the existing port infrastructure avoids the need for new permanent facilities and helps minimise environmental disturbance. All operations within the temporary base will be conducted in coordination with port authorities and in accordance with established safety, environmental, and traffic management procedures.

A layout of the facility, including operational zoning, is presented in Figure 6-6, while the geographical location within the port area is shown in Section 1.3.1.4.

Figure 6-6: Zone 2 pictogram – staging area for loading the vessel

The indicative main operational zones of the temporary supply base are described below:

- The Supply Base is expected to comprise an open yard storage area of up to approximately 13,000 m<sup>2</sup> of level paved or interlocked hardstanding located within a secure port facility compliant with the International Ship and Port Facility Security (ISPS) Code. The yard will include appropriate drainage and operational lighting systems together with internal access routes suitable for heavy vehicle movements and logistics operations.
- Quayside infrastructure is expected to include a dedicated berthing arrangement for PSVs, with an indicative quay length of approximately 100 m and water depths in the range of approximately 8–10 m. Berthing facilities will utilise existing quayside infrastructure suitable for offshore logistics operations.
- A dedicated staging area will be made available adjacent to the berth to enable safe and efficient loading of the PSVs.
- Temporary covered storage facilities may also be utilised, comprising warehouses or sheltered storage areas with concrete flooring and lighting. The indicative covered storage area is expected to range between approximately 500 and 1,000 m<sup>2</sup>, depending on operational requirements.
- Utilities and ancillary services are expected to include electricity supply, operational lighting and fresh water supply capability at the quayside, provided via pipeline connection.
- Waste management facilities will be provided for the temporary handling and segregation of waste generated at the Supply Base and waste backloaded from the MODU and support vessels. Waste handling, temporary storage and onward transfer will be undertaken in accordance with applicable port requirements and national waste-management legislation. MARPOL requirements will apply to the management and transfer of ship-generated waste, as applicable.

This operational zoning supports the orderly segregation of storage, staging, and material-handling activities, while also identifying areas where enhanced environmental and safety controls can be applied, particularly at the quayside interface and within high-traffic logistics corridors.

Supporting infrastructure will include prefabricated, portable office units; security huts at entry and exit points; a clearly defined perimeter and temporary fence line controlling access to the operational area; and a quarantine storage area for materials requiring inspection or temporary isolation.

Loading, unloading and material handling activities will be supported by conventional mobile logistics equipment typically used in offshore drilling support operations. Indicative equipment may include:

- Forklifts with lifting capacities of approximately 11 tonnes and 16 tonnes, equipped with side-shift capability and load indication systems;
- One semi-trailer (minimum indicative length of 40 ft) with prime mover and driver;
- Trailers fitted with steel headboards, casing bolsters and appropriate load securing arrangements;
- One heavy-duty truck (semi-trailer configuration) with an indicative carrying capacity of approximately 40 tonnes;
- Light duty 4x4 pick-up vehicles for personnel transport and support activities; and
- A certified wharf crane with an indicative lifting capacity of approximately 160 tonnes, with crane services available on a call-out basis, including during night-time operations, weekends and public holidays, depending on operational requirements.

The Supply Base facilities and equipment described above represent a typical and indicative offshore drilling logistics configuration consistent with standard industry practice for supporting deepwater exploration campaigns. As the Project will utilise existing port infrastructure and conventional logistics equipment, the associated environmental impacts are expected to be temporary, localised and limited in nature.

#### 6.4.4.2 Corfu International Airport

---

A temporary helicopter hangar will be installed within the existing infrastructure footprint of Corfu International Airport (CFU) to support offshore helicopter operations during the drilling campaign.

The hangar will be used exclusively for helicopter staging, parking, and routine servicing during the offshore exploration drilling campaign. Its installation will not expand the airport's footprint or alter its existing operational role or capacity. The temporary hangar will be removed following completion of drilling activities.

### 6.5 Drilling Preparation and Mobilisation Phase

#### 6.5.1 Installation and Setup of Onshore Facilities

---

A temporary onshore logistics base (Supply Base) will be established within an existing operational area of the Port of Igoumenitsa to support the offshore drilling campaign. The facility will be fully operational before the arrival of the offshore drilling unit to ensure that all required infrastructure, equipment, procedures and personnel are in place to support safe and efficient drilling activities.

The establishment of the Supply Base will utilise existing port infrastructure and services and will not require the construction of new permanent facilities. Preparatory activities may include the temporary allocation and demarcation of operational areas, installation of portable office units, positioning of storage containers and material-handling equipment, establishment of designated storage and laydown areas, installation of temporary fencing and security arrangements, where required, and connection to existing utility services, such as electricity and water. Minor site preparation activities may be undertaken to organise operational zones and traffic management arrangements; however, no dredging, land reclamation, quay modifications or other substantial civil works are anticipated.

Operational areas within the Supply Base will be organised to facilitate the safe segregation of materials, equipment, vehicle movements and personnel. Dedicated areas may be designated for cargo staging, tubular storage, container storage, waste management, quarantine storage and loading/offloading activities adjacent to the quayside. The final layout and configuration of the Supply Base may vary depending on operational requirements, contractor arrangements and port authority requirements. In any case, they will remain within existing authorised port areas and will not alter the overall scope or environmental footprint of the Project.

A temporary helicopter hangar will be installed within the existing infrastructure of Corfu International Airport (CFU) to support offshore aviation activities during the drilling campaign. The hangar will be installed prior to the commencement of offshore operations by an airport-approved contractor, in accordance with all applicable airport procedures, aviation safety requirements and permitting conditions.

The temporary hangar will provide sheltered facilities for helicopter parking, routine inspection, maintenance support, equipment storage and operational preparation associated with crew transport and emergency response activities. Installation activities are expected to involve the assembly of prefabricated structural components and connection to existing airport utility services where required. No expansion of the airport boundary, runway infrastructure, apron areas or aviation facilities will be necessary. The temporary installation will be located within an area already designated for aviation-related activities and will operate in coordination with airport management and air traffic control procedures.

Both the Supply Base and helicopter hangar will remain in place only for the duration of the drilling campaign. Upon completion of operations, all temporary facilities, equipment and materials will be removed, and the areas utilised by the Project will be left in the condition agreed with the relevant port and airport authorities. Consequently, the establishment of these facilities is expected to result in only temporary and localised effects within existing industrial and transportation infrastructure areas.

## 6.5.2 MODU Staging, Support Vessels, and Pre-Mobilisation Activities

---

Before mobilising to the Asopus 1 well location, the drilling unit will complete pre-mobilisation and staging activities at a suitable port, shipyard, or offshore staging site. The final staging location is yet to be determined, but it will be an established facility equipped to support inspection, preparation, certification checks, and loading.

Pre-mobilisation activities will include all required regulatory, technical, and operational readiness checks before entering the operational area. These checks confirm that the drilling unit, its systems, and documentation comply with statutory, class, flag state, and Project requirements.

As part of the rig acceptance process, the MODU's pollution prevention and ballast water management arrangements will be verified, along with relevant documentation regarding the hull and biofouling management. The need for any inspection or corrective action will be determined through the applicable vessel-assurance process, considering the MODU's operating history, available records, applicable requirements, and relevant IMO guidance. Any required cleaning will be undertaken at a facility authorised for that activity.

Platform supply vessels from the Mediterranean region are expected to support the offshore exploration drilling campaign. Before commencing operations and being accepted on hire, support vessels will hold valid statutory and environmental certifications required under applicable international maritime conventions, including MARPOL and the Ballast Water Management Convention, as transposed into Greek law. They will undergo Project verification and acceptance to confirm vessel suitability, safety, and environmental performance.

The drilling unit will be loaded with required consumables and materials, such as fuel, water, equipment, and stores, before departing the staging location or, if appropriate, through the Project logistics chain after mobilisation. Equipment, materials, and consumables required for the drilling campaign may originate from multiple regional or international locations. The ESIA assessment of Project logistics is based on the transport activities undertaken through the Project supply chain and within the defined assessment boundary. Where applicable, items will be transported to the Igoumenitsa supply base using existing

transport routes, primarily via established road freight services and, where necessary, by coastal or regional marine transport.

Offshore drilling will begin only after the drilling unit arrives at the well location, completes required positioning and pre-spud checks, and meets all regulatory, operational, and safety requirements.

### 6.5.3 Mobilisation and positioning of the MODU

The drilling unit will mobilise to the Asopus-1 well location using its own propulsion system. Mobilisation activities will be limited to the transit of the MODU to the operational area, rig intake process until the rig is formally accepted on hire, and preparatory activities before the commencement of drilling operations.

Upon arrival at the operational area, acoustic positioning transponders will be temporarily placed on the seabed to support accurate station keeping; the transponders will be recovered at the end of operations. The MODU will then be ballasted to achieve its drilling operating draft, which improves stability, reduces susceptibility to wave-induced motions such as rolling and pitching and provides a stable platform for drilling operations. The MODU's position will be maintained using its dynamic positioning (DP) system, which controls thrusters based on satellite navigation and acoustic reference systems. No anchors will be deployed, and no anchor handling or anchor-related seabed disturbance will occur. Seabed interaction associated with the temporary positioning transponders will be minor and spatially confined, and the transponders will be recovered following completion of operations.

Before spudding the well, the MODU-deployed ROV will conduct a seabed inspection at the well location. If any previously unidentified seabed features or sensitivities are observed, the relevant authorities will be informed, as applicable. Any further investigation, avoidance measure or proposed adjustment to the well location will be reviewed against the spatial and technical basis of the Project and addressed in accordance with the applicable regulatory requirements before drilling commences.

## 6.6 Drilling Phase

### 6.6.1 Overview of the drilling process

The Asopus 1 exploration well will be drilled using established offshore exploration drilling practices, progressing sequentially from shallow seabed sections to the planned final depth. Well construction will be carried out in accordance with the Notification of Well Operations (NoWO) accepted by HEREMA before commencement of drilling, with well control and integrity maintained throughout the operation. The operations include:

- Riserless drilling of shallow top-hole sections, during which water-based drilling fluids and rock cuttings are discharged at the seabed; and
- Risered drilling, following installation of the marine riser and blowout preventer (BOP), during which drilling returns are routed to the MODU.

Figure 6-7 illustrates the drilling configurations used for the exploration well. It distinguishes between riserless drilling of shallow sections, where water-based fluids and rock cuttings are discharged directly to

the seabed, and risered drilling of deeper sections, where returns are routed to the MODU. On the MODU, drilling fluids are processed and conditioned for reuse, while drill cuttings and residual fluids are managed in accordance with the drilling-fluid system and applicable regulatory requirements.

Figure 6-7: Main stages of drilling

Drilling will begin by jetting the 36-in conductor below the mudline using seawater and high-viscosity gel sweeps. This step establishes the well's structural foundation and will disturb approximately 0.66 m<sup>2</sup> of seabed. After installing the conductor, the 26-in hole section will be drilled with seawater and periodic gel sweeps. Before installing the 20-in surface casing, the system will be displaced to water-based mud (WBM), then the surface casing will be run and cemented. During these riserless sections, the drilling fluids and cuttings are discharged directly to the seabed near the well. Riserless drilling is limited to shallow sections above the depth where the blowout preventer (BOP) is installed.

After installing and cementing the 20-inch surface casing, the BOP will be deployed on the marine riser to establish a closed circulation system between the MODU and the well. The BOP provides secondary mechanical well control and enables the well to be shut in and secured if an influx occurs or the primary well barrier is lost. The BOP and its connection will be tested and verified before drilling operations continue.

The closed-loop circulating system enabled by the riser will allow fluids and cuttings to be processed using the rig's solids control equipment, including shale shakers and centrifuges. Drilling fluids may be conditioned and reused, while cuttings and residual fluids will be managed in accordance with the drilling fluid system in use and applicable regulatory requirements.

## 6.6.2 Well design

The well construction sequence assessed in this ESIA is defined by the indicative casing schedule presented in Table 6-6, which sets out the sections, casing sizes, drilling fluid systems, and approximate depths used

to assess drilling discharges, seabed disturbance, and contingency scenarios. Final casing setting depths and well design parameters will be confirmed during detailed well planning and within the approved NoWO.

**Table 6-6: Indicative well casing plan for Asopus-1 Base Case**

| NO. | SECTION NAME                                   | DRILLING FLUID | HOLE SIZE |     | CASING SIZE |     | DEPTH BELOW SEABED | LENGTH OF HOLE SECTION |
|-----|------------------------------------------------|----------------|-----------|-----|-------------|-----|--------------------|------------------------|
|     |                                                |                | IN        | MM  | IN          | MM  | M MD               | M                      |
| 1   | 36-in Conductor Jetting                        | Seawater / WBM | -         | -   | 36          | 914 | ±70                | ±70                    |
| 2   | 26-in Hole x 20-in Surface Casing              | Seawater / WBM | 26        | 660 | 20          | 508 | ±730               | ±660                   |
| 3   | 17-1/2-in Hole x 13-5/8-in Intermediate Casing | WBM            | 17-1/2    | 444 | 13-5/8      | 346 | ±1,212             | ±482                   |
| 4   | 12-1/4-in Hole x 9-5/8-in Intermediate Liner   | WBM            | 12-1/4    | 311 | 9-5/8       | 245 | ±2,407             | ±1,195                 |
| 5   | 8-1/2-in Hole                                  | WBM            | 8-1/2     | 216 | -           | -   | ±3,750             | ±1,343                 |

Based on the current well design, the drilling sequence comprises:

- Mobilise the drilling rig within the operational area. Prepare to start drilling (spud).
- Jet the 36-in conductor.
- Drill ahead the 26-in hole section. Run and cement the 20-in surface casing.
- Run the K-BOS on drill pipe.
- Run the BOP on the marine riser.
- Drill the 17-1/2-in hole section. Run and cement the 13-5/8-in intermediate casing.
- Drill the 12-1/4-in hole section - this section has a contingent wireline logging programme.
- Run and cement the 9-5/8-in liner.
- Drill the 8-1/2-in open-hole evaluation section and conduct wireline logging to evaluate the primary target. The interval will subsequently be isolated by the permanent abandonment barriers installed during P&A.
- Plug and abandon (P&A) the well using cement barriers.

The programme reflects a conservative exploration design based on current geological understanding. The final well design will be confirmed through detailed engineering and the NoWO process. Operational adjustments during well construction will remain subject to the approved well programme and applicable change-management and regulatory requirements. Any change that materially exceeds the environmentally relevant parameters assessed in this ESIA will be addressed in accordance with the applicable environmental permitting requirements.

The Project design envelope includes potential contingency activities, such as sidetrack drilling, re-drilling of individual sections, and re-spudding, should these be required in response to well conditions or operational circumstances. These activities are not part of the planned base case.

Well testing, flowback, and flaring are not included within the scope of the Project. No hydrocarbons, formation water or reservoir fluids will be intentionally flowed to the MODU for the purposes of well testing or production. Well-construction returns will be managed through the MODU's circulation, treatment and

well-control systems, as applicable. Any future proposal to conduct well testing would require separate regulatory submissions, environmental assessment, and approval.

### 6.6.3 Drilling

---

Drilling operations commence with establishing a controlled well environment using the drilling fluid system to maintain hydrostatic pressure in the wellbore and prevent formation influx. During the riserless sections, seawater, viscous sweeps, water-based drilling fluids and cuttings are discharged at the seabed. After installation of the BOP and marine riser, water-based mud is circulated down the drill string and returned to the MODU via the marine riser, transporting drilled cuttings for processing through the solids control equipment. Conditioned drilling fluid is then recirculated where practicable to maintain stable wellbore conditions.

As drilling progresses, sections of the well are drilled sequentially to target depth intervals. Following completion of the applicable hole sections, the specified casing string or liner is installed and cemented in place. The conductor is jetted without cementing, and no casing string is currently planned for the final 8½-in hole section. Where applicable, cement slurry is pumped down the casing and returned through the annulus to secure zonal isolation, provide well integrity, and enable continued drilling into deeper formations. Pressure testing is conducted after cementing and casing installation to confirm integrity of the well barriers.

During drilling, well pressure will be managed primarily by controlling drilling-fluid density and hydrostatic pressure. If required by the encountered pressure conditions, MPD may be used to apply controlled surface backpressure and maintain bottom hole pressure within the defined operating limits.

If an influx of formation fluid into the wellbore occurs, the well will be secured using the BOP system in accordance with the applicable well-control procedures. Depending on the circumstances, the annular or ram preventers may be closed to shut in the well. The shear rams are available where shearing and sealing are required. Following shut-in, the influx may be circulated from the well in a controlled manner through the choke-and-kill system.

Where returns contain entrained gas, they may be routed through the mud-gas separator, where gas is separated and vented through the designated system, and the remaining fluids are managed through the MODU's fluid-treatment system, as appropriate.

Throughout drilling, operations are continuously monitored and controlled via integrated surface and subsea control systems, providing real-time feedback on pressure, flow, and well conditions. Emergency systems, including automatic shutdown, ROV intervention, and acoustic control, provide additional assurance that the well can be safely secured under a range of failure scenarios.

### 6.6.4 Cementing

---

Cementing operations will be conducted following installation of each casing string to provide zonal isolation and mechanical support.

The conductor will be jetted without cementing. The 20-in surface casing will be cemented, with a planned excess volume to ensure full annular coverage and returns to the seabed. Cement returns to the seabed

may occur during cementing of the surface casing and have been included in the drilling-discharge assessment.

Subsequent cementing operations will be conducted with returns to the MODU through the marine riser. Excess cement may be circulated out during cleaning or contingency scenarios.

### 6.6.5 Formation Evaluation

---

Following drilling of each relevant hole section, formation evaluation activities will be undertaken to characterise subsurface geology and assess the presence and properties of any hydrocarbons encountered. These activities are limited to data acquisition and interpretation and do not involve hydrocarbon production, flow testing, or flaring.

Formation evaluation for the Asopus-1 exploration well will include a combination of logging while drilling (LWD), mudlogging, biostratigraphy, and wireline logging. These techniques will be used to acquire continuous measurements of subsurface formations during and after drilling of selected hole sections. After drilling the last section, data acquisition is expected to require up to approximately 7 days, depending on well conditions and data quality.

The final combination of formation-evaluation techniques will be selected based on the data acquired, encountered well conditions and the remaining exploration objectives, within the Project envelope.

Upon completion of formation evaluation, logging tools will be recovered to surface, evaluation data will be reviewed on the MODU, and the well will proceed to permanent plug and abandonment. No field formation evaluation activities extend beyond the Project scope.

#### 6.6.5.1 Logging-while drilling (LWD)

---

During drilling, LWD tools integrated into the drill string may be used to collect real time measurements, including gamma ray, resistivity, density, neutron porosity, and sonic properties. In parallel, mudlogging will be conducted at the MODU to analyse drill cuttings and drilling fluid returns. Mudlogging provides information on lithology, formation fluids, and gas content, and supports real time operational decision making.

#### 6.6.5.2 Wireline Logging (WL)

---

Upon drilling a hole section of interest, wireline logging may be undertaken to acquire higher resolution formation data. Wireline tools may include, as applicable, Gamma Ray and Spectral Gamma Ray, Resistivity and Resistivity Imaging, Density and Neutron Porosity, Dipole Sonic, Nuclear Magnetic Resonance, Dielectric and Elemental Analysis Tools, VSP, Formation Pressure Reading and Sampling Tools, and Rotary Sidewall Coring.

Wireline logging is conducted with the well in a controlled, non-flowing condition. The operations will not involve continuous flow of reservoir fluids to the MODU or well testing. Where formation-fluid sampling is undertaken, small volumes may be captured within sealed downhole sampling chambers and recovered to the MODU with the wireline tool.

A zero-offset VSP survey may be conducted in up to two well sections. Each VSP operation will use a sound source array of approximately 750–1,000 in<sup>3</sup>, deployed approximately 5–10 m below the sea surface from the MODU. The source may fire up to five shots per station at approximately 15-second intervals. Each VSP operation is expected to last up to 12 hours and may comprise up to approximately 130 acoustic pulses, giving a maximum assessed total of approximately 260 pulses across the two potential VSP operations.

Formation-pressure measurements may be acquired using wireline tools to assess subsurface pressure conditions and fluid properties. Where fluid sampling is undertaken, only small, contained volumes will be captured within downhole sampling chambers. Any hydrocarbon sample recovered on the MODU will be handled in accordance with the applicable sampling and laboratory procedures. Small quantities of gas may be released during controlled sample handling or analysis; this does not involve continuous reservoir flow or constitute well testing.

Some LWD and wireline tools may incorporate sealed radioactive sources, such as Americium-Beryllium and Caesium-137, for density and neutron measurements. These sources are fully encapsulated and will be managed in accordance with the applicable source certification, transport, storage, handling and licensing requirements. Sources will be deployed and recovered with the logging tools and will not be intentionally released into the well or marine environment. Handling, storage, transport and use will comply with applicable Greek Atomic Energy Commission requirements and EU Directive 2013/59/Euratom.

## 6.6.6 Contingency Activities

In case technical or operational issues arise during drilling, contingency measures may be necessary. These activities are not part of the planned base case but have been considered within the ESIA contingency envelope where relevant. If undertaken, they may increase operational duration, drilling-fluid and cement use, cuttings and fluid discharges, and localised seabed disturbance compared with the planned well programme.

- Re-Spudding may be necessary if issues arise that make it impractical to continue drilling the current well. Causes include downhole failure or construction outside tolerance, such as excessive conductor inclination. Re-spudding is most often required during riserless operations, where remediation options are limited. A re-spud would generate additional cuttings and drilling-fluid discharges and may require additional cement, depending on the stage at which it is undertaken.
- Sidetrack (as an alternative to a well re-spud) involves drilling a secondary wellbore away from the primary wellbore to bypass unusable or inaccessible sections. A sidetrack may be required to bypass an unusable or inaccessible section of the original wellbore, respond to downhole mechanical problems, or achieve the well objectives where the original trajectory cannot be continued.
- If required, the initial hole will be abandoned in accordance with regulations and good industry practices using cement plugs. A higher-density cement plug or a downhole kick-off tool (whipstock) will separate the new wellbore from the original. A window may be milled into the original casing to create an opening for the new wellbore, and the drilling assembly will be guided through this window to continue drilling. Subsequent activities may follow the original wellbore plan. If required, a sidetrack would remain associated with the Asopus-1 exploration well within Block 2. Its implementation would be subject to the approved well programme, applicable management-of-change procedures and any regulatory

notification, acceptance or environmental-permitting requirements arising from the proposed change.

- Temporary interruption of operations may be required during the drilling campaign due to adverse weather, equipment issues, or other operational circumstances. Where disconnection from the well is required, the well will be secured using the applicable well barriers and disconnect procedures before the MODU moves off location. Operations may resume once conditions allow and the applicable operational and regulatory requirements have been satisfied. Long-term suspension is not part of the Project scope assessed in this ESIA; following completion of drilling and formation evaluation, the well will be permanently plugged and abandoned.
- A contingent Emergency Disconnect Sequence (EDS) may be initiated in the unlikely event the MODU needs to rapidly disengage from the well (e.g., due to severe weather). The sequence secures the well through the applicable BOP functions before disconnection of the lower marine riser package. Activation may result in the release of some riser contents, including drilling fluid and entrained cuttings, to the marine environment.
- Fluid loss to formation will be managed using loss circulation material (LCM) such as polymers or other additives to maintain the stability of the wellbore. For severe fluid loss, it may be necessary to pull back, cement the affected area, and then drill through the cement to resume operations.
- Contingent Cementing Operations may be necessary as contingent measures in response to unplanned events, such as kick-off plugs, failed formation integrity tests, or lost-circulation remediation.
- Explosives may be maintained onboard in limited quantities as a contingency measure for mechanical pipe severance (for example in stuck-pipe scenarios). No Tubing-Conveyed Perforating (TCP) or other reservoir-targeting explosive operations are planned for the Asopus-1 campaign. The charges are precision-engineered, self-contained devices designed to focus energy inward on the drill string. Their use is not expected to result in a routine chemical discharge to sea. Tool components and severed tubulars will be recovered where operationally practicable, while any unrecovered material will be managed in accordance with the applicable operational and regulatory requirements. The types and quantities of explosive cutting tools held onboard, and their storage, handling, and use, will be controlled in accordance with applicable legal requirements, vessel procedures, and specialist-vendor arrangements.

## 6.6.7 Spill Prevention and Response

Measures to prevent and respond to accidental releases of fuels, oils and chemicals from the MODU and support vessels are addressed through the applicable vessel safety and environmental management systems and Project emergency response procedures. These arrangements include operational controls, appropriate containment, spill-response equipment, trained personnel, notification requirements and product-specific response information.

Response to oil pollution incidents will be undertaken in accordance with the applicable vessel Shipboard Oil Pollution Emergency Plan (SOPEP). Releases involving other chemicals will be managed through the relevant vessel and Project emergency procedures, taking account of the substance involved, its Safety Data Sheet and the nature and scale of the release. These arrangements will be implemented in accordance with

applicable international, EU, Greek, flag-State, and port-State requirements and will be supported by the relevant drills and exercises.

## 6.6.8 Logistics support and transport activities

Support activities for the Asopus 1 exploration drilling programme comprise marine logistics, aviation support, and remotely operated vehicle (ROV) operations. These activities are limited to the duration of the drilling campaign, for which the quantified assessment is based on an offshore campaign of approximately 67 days.

The logistics envelope presented in Table 6-7 is based on Project logistics and crew-change planning, and includes allowances for routine supply, mobilisation and demobilisation, short-notice requirements, staggered personnel movements, and weather-related rescheduling. The upper values represent the quantities used for the applicable environmental assessments

Marine and aviation movements are expressed as one-way transits and one way flight sectors, respectively. A vessel round trip therefore comprises two one-way transits, and a helicopter round trip between Corfu International Airport and the MODU comprises two one-way flight sectors.

In the unlikely event of an emergency, additional vessel or aircraft movements may be required to support medical, safety, spill response, or other emergency activities. Such unplanned movements cannot be predicted in advance and are therefore not included in the routine logistics envelope. They are considered qualitatively within the ESIA assessment of unplanned events and emergency response arrangements.

**Table 6-7: Summary of Quantified Marine and Aviation Activities**

| ACTIVITY                         | ASSESSED OPERATIONAL ENVELOPE                                    |
|----------------------------------|------------------------------------------------------------------|
| PSV transits                     | Up to 6 one-way transits per week                                |
| PSV campaign total               | Approximately 58–60 one-way transits                             |
| PSV total sailing distance       | Approximately 7,500–7,800 km                                     |
| Helicopter flights               | Approximately 12 one-way flight sectors per week (6 round trips) |
| Helicopter campaign total        | Approximately 115–120 one-way flight sectors                     |
| Helicopter total flight distance | Approximately 9,400–9,800 km                                     |

### 6.6.8.1 Shore base activities

The logistics area will operate within a defined leased or allocated area of the port, with access restricted to authorised personnel. Shore-base activities will be coordinated with the Port Authority and conducted in accordance with the established port operating procedures and applicable health, safety, security, traffic management and environmental requirements, as indicated in the approved Environmental Terms (Decision ΥΠΕΝ/ΔΙΠΑ/12891/794/17.03.2022). Materials will be stored and handled within designated areas using the applicable containment and segregation controls.

Shore base activities will be limited to the receipt, temporary storage, staging, load-out and onward transfer of items associated with the offshore exploration operations. These activities will include routine supply to

the MODU and the backloading of equipment, materials and segregated waste streams returned from offshore.

A range of drilling-related materials may be handled at the shore base in support of the exploration campaign. All activities will be conducted within an existing, permitted port facility and will not require the construction of new permanent infrastructure, modification of existing port facilities, dredging, or other seabed works. No liquid mud plant (LMP) will be installed at the onshore support facilities (Port of Igoumenitsa) for the proposed exploration activities.

#### 6.6.8.1.1 Storage of Well Equipment and Supplies

The Igoumenitsa Supply Base will provide temporary storage for drilling tubulars, wellheads, packaged chemicals, drilling consumables and other equipment required for the Asopus-1 campaign. Materials received from suppliers will be inspected, recorded and stored in designated laydown or storage areas before consolidation and loading onto PSVs.

No bulk liquid mud plant or permanent chemical-storage facility will be established at the Supply Base. The types and quantities of materials stored will remain within the limits and conditions established by the applicable port approvals and relevant Greek hazardous-material, fire-safety and environmental requirements. Chemicals and other materials presenting a potential release risk will be stored in designated areas with appropriate segregation and secondary containment, considering their form, classification, and storage requirements. Safety Data Sheets and inventory records will be maintained as applicable, and storage areas will be subject to routine inspection.

Cargo will be prepared and transferred using certified lifting equipment and established manifest, weight-control and lifting procedures. Equipment, materials and segregated waste streams returned from the MODU will be offloaded and temporarily staged in their designated areas. Equipment and reusable materials will be transferred to the relevant vendors or maintenance facilities, while waste will be transferred through licensed contractors to authorised recovery, treatment or disposal facilities, as applicable.

Project-specific temporary installations will be removed following completion of the drilling campaign.

#### 6.6.8.1.2 Waste Storage and Transfer

Waste generated offshore will be segregated at source, classified, packaged, and labelled according to the waste type and applicable transport requirements before being backloaded to the Supply Base. Hazardous and non-hazardous waste streams will be maintained separately to prevent cross-contamination and incompatible wastes will not be stored together.

On arrival at the Supply Base, waste containers and accompanying documentation will be checked before transfer to the designated temporary staging area. Any damaged, leaking, incorrectly labelled or otherwise non-compliant container identified during transfer will be contained and managed in accordance with the applicable vessel, shore-base and port procedures before onward transportation.

No long-term storage of Project waste is planned at the Supply Base. Waste will be staged temporarily for the period necessary to arrange onward transfer through licensed waste transporters to authorised recovery,

treatment or disposal facilities. Hazardous waste and liquid waste will be stored in designated areas using containment and segregation measures appropriate to the waste type.

Indicative waste streams managed through the Supply Base may include waste oils, oily materials, spent chemicals, paints and solvents, batteries, aerosols, clinical waste, electrical and electronic equipment, scrap metal, wood, glass, packaging, domestic waste and food waste. Each waste stream will be classified based on its composition and applicable waste-classification requirements.

Waste transfers will be supported by the classification, manifest, consignment and transport documentation required for the applicable waste stream and mode of transport. Dangerous goods will additionally be packaged, labelled and documented in accordance with the applicable transport requirements, including the IMDG Code for marine transport where relevant. Waste records will be maintained to provide traceability from offshore generation through to the authorised receiving facility.

Waste-handling personnel will receive training appropriate to their responsibilities. Spill-prevention and response arrangements will be applied during waste transfer and temporary staging, and any incident or non-conformance will be managed through the applicable shore-base and port procedures.

#### 6.6.8.1.3 Shore-based Transfers

Shore-based transfers will support the movement of equipment, materials, consumables and segregated waste streams between the Supply Base and the MODU. Materials received from suppliers will be checked against the applicable cargo documentation and directed to designated storage or staging areas before preparation for offshore transport.

At the quayside, cargo will be loaded onto and offloaded from PSVs using suitable certified lifting equipment, trained personnel, cargo manifests, weight-control arrangements and applicable lifting procedures. Equipment and reusable materials returned from the MODU will be transferred to the relevant vendors or maintenance facilities. Waste will be temporarily staged and transferred to authorised recovery, treatment, or disposal facilities through licensed contractors, as applicable.

Transfer activities will apply containment and spill-response controls appropriate to the materials handled. Vehicle access, cargo movements, and quayside activities will be coordinated with the Port Authority and managed in accordance with the applicable port safety, security, traffic management, and environmental procedures.

#### 6.6.8.2 Marine Logistics – Support Vessels

Marine support will be provided by two PSVs operating on an alternating basis between the MODU and the Igoumenitsa Supply Base. A maximum of two PSVs may operate within the operational area at any one time. No dedicated standby vessel is planned for routine operations. Emergency response will be supported by the MODU, available PSVs, aviation support and the Project's emergency response arrangements.

Marine logistics activities will be conducted in accordance with applicable international and national requirements, including the MARPOL Convention, relevant provisions of the Barcelona Convention and its Offshore Protocol, and the Project's Environmental Terms, once issued under Law 4014/2011.

The well is located approximately 130 km (70 nautical miles) from Igoumenitsa along established navigation routes. The typical one-way PSV transit time is approximately seven hours under normal operating conditions.

The logistics plan is based on alternating PSV runs, with one vessel potentially present at or near the MODU while the other transits to or from the Supply Base. For assessment purposes, up to six one-way PSV transits per week have been assumed, including allowance for mobilisation and demobilisation, urgent logistics requirements, weather-related rescheduling and occasional overlap of PSV operations. Over the 67-day offshore campaign, this corresponds to approximately 60 one-way transits and a total assessed sailing distance of approximately 7,600 km.

Bulk materials such as cement and barite/bentonite will be transported as dry bulk and pneumatically transferred from the PSVs to storage tanks on the MODU. These transfers will use closed transfer systems, tank venting arrangements, and visual monitoring to minimise material loss.

Support vessels will use Marine Gas Oil or another compliant marine fuel with a sulphur content not exceeding 0.10% m/m, in accordance with MARPOL Annex VI and the Mediterranean Sea SOx Emission Control Area requirements.

#### 6.6.8.2.1 Refuelling

The MODU will be refuelled offshore from PSVs as required during the drilling campaign. Fuel transfer between a PSV and the MODU will be undertaken in accordance with the applicable vessel procedures and Project marine-operating requirements, including pre-transfer checks, communication between the vessels, monitoring of the transfer and spill-prevention and emergency-shutdown arrangements.

PSV refuelling will be undertaken in port using existing licensed fuel-supply arrangements. Fuel may be supplied directly at the quayside by road tanker or by an authorised third-party bunkering provider, subject to Port Authority requirements and the arrangements approved for the relevant berth. Refuelling may take place at the designated Supply Base quay or another approved operational berth within the port.

Fuel transfers will be undertaken in accordance with the applicable bunkering procedures, with controls appropriate to the transfer method. These will include confirmation of available tank capacity, verification of transfer connections and hose condition, agreed communication and emergency-stop arrangements, monitoring throughout the transfer, and availability of suitable spill-response equipment.

The quantity and frequency of PSV refuelling will depend on vessel schedules, offshore operational requirements and vessel fuel consumption. No Project-specific fuel storage facility will be established at the Supply Base; the Project will rely on the existing licensed fuel supply and bunkering arrangements available within the Port of Igoumenitsa and the wider regional marine fuel supply network.

#### 6.6.8.3 Helicopter support – Aviation services

Aviation support will involve helicopter operations between the MODU and Corfu International Airport. The well is approximately 82 km (44 nautical miles) from the airport, corresponding to a typical one-way flight time of 20–25 minutes for a twin-engine medium offshore helicopter, such as an AW139 class aircraft, under normal operating conditions. Helicopters will primarily support personnel transfers, including routine crew

changes, and may also be used for emergency response, including medical evacuation. Routine cargo-only flights are not planned.

Crew changes are expected to involve approximately 50–60 personnel per week. Flights may operate below their maximum passenger capacity because of staggered schedules, specialist personnel movements, baggage and payload constraints, meteorological conditions and operational requirements.

For assessment purposes, the aviation logistics envelope comprises approximately six round-trip flights per week, equivalent to 12 one-way flight sectors. This includes allowance for increased activity associated with mobilisation and demobilisation, short-term rescheduling and additional personnel movements. Over the 67-day offshore campaign, the assessed envelope comprises approximately 118 one-way flight sectors and a total flight distance of approximately 9,600 km.

Helicopter flight planning will be coordinated with Corfu International Airport and the relevant aviation authorities. Flight routes will be determined taking account of aviation safety, meteorological conditions, airspace requirements and air-traffic-control instructions. Where operationally practicable, unnecessary overflight of densely populated areas will be avoided. Routes may vary as required for safety, weather, air traffic control, or operational reasons.

## 6.7 Inputs of materials, energy, and water

### 6.7.1 Use of Chemicals

---

The Asopus-1 offshore exploration drilling campaign will involve the use of a defined range of chemicals in accordance with Energean's HSE Management System and the applicable EU and Greek regulatory framework. These chemicals are required to support exploration drilling and general vessel operations.

In line with the Mediterranean Offshore Guidelines, the main categories include drilling-fluid chemicals, cement and cement additives, other well-construction chemicals, and chemicals used for routine vessel operations. The chemical inventory also includes identified contingency products that may be held onboard but are not part of the planned base case. Chemicals used solely for routine vessel operation and maintenance are managed separately through the vessel's chemical, waste and discharge-control arrangements.

#### 6.7.1.1 Chemical Selection and Environmental Considerations

---

Only water-based mud systems will be used during the drilling campaign. These systems and their associated additives have been selected based on technical performance, well-integrity and safety requirements, and environmental characteristics, with preference, where technically feasible, given to products with lower toxicity, favourable biodegradability, and low potential for bioaccumulation.

In practical terms, chemicals have been selected through a screening process that considers:

- (i) intrinsic environmental hazard, using recognised classification schemes and hazard data,
- (ii) expected discharge quantities and exposure pathways,

- (iii) operational and safety requirements, and
- (iv) availability of technically feasible alternatives.

Where Mediterranean-specific chemical classification data are not available, internationally recognised systems such as OSPAR HOCNF and OCNS are applied as screening tools. These frameworks provide a conservative and well-established basis for environmental hazard assessment and are used to support, rather than replace, the requirements of the Mediterranean Offshore Guidelines.

The proposed chemical inventory, intended functions, usage status and maximum estimated quantities are presented in the Chemical Use Plan (**Annex 05**). The inventory includes products proposed for planned use and products retained for contingency use during the well programme. The inclusion of a product in the CUP does not necessarily mean it will be used. Chemical use will remain subject to the applicable HEREMA review and approval requirements. An indicative summary is presented in Table 6-8.

**Table 6-8: Indicative List of Chemicals**

| CHEMICAL                    | FUNCTION                         | PRIMARY /<br>CONTINGENCY<br>CHEMICAL | CHEMICAL FUNCTION<br>GROUP |
|-----------------------------|----------------------------------|--------------------------------------|----------------------------|
| <i>Riserless Section</i>    |                                  |                                      |                            |
| <i>Bentonite</i>            | Viscosifying agent               | Contingency                          | WBM additive               |
| <i>Caustic soda</i>         | Alkalinity control               | Primary                              | WBM additive               |
| <i>Soda ash</i>             | Water Hardness Control           | Primary / contingency                | WBM additive               |
| <i>PAC UL</i>               | Fluid loss control agent         | Primary                              | WBM additive               |
| <i>CMC HV</i>               | Fluid loss control agent         | Contingency                          | WBM additive               |
| <i>PAC R</i>                | Fluid loss control agent         | Primary                              | WBM additive               |
| <i>NaCl</i>                 | Salt - clay inhibition           | Primary                              | WBM additive               |
| <i>Barite</i>               | Weighting agent                  | Contingency                          | WBM additive               |
| <i>Defoamer</i>             | Defoamer                         | Contingency                          | WBM additive               |
| <i>Modified starch</i>      | Fluid loss control agent         | Primary                              | WBM additive               |
| <i>XC Polymer</i>           | Viscosifying agent               | Primary                              | WBM additive               |
| <i>Class G - Cement</i>     | Cement                           | Primary                              | Cement or Cement Additive  |
| <i>Defoamer</i>             | Defoamer                         | Primary                              | Cement or Cement Additive  |
| <i>Retarder</i>             | Retarder                         | Primary                              | Cement or Cement Additive  |
| <i>Potassium Chloride</i>   | Salt / shale-inhibition additive | Primary                              | Cement or Cement Additive  |
| <i>Silicate liq.</i>        | Extender                         | Primary                              | Cement or Cement Additive  |
| <i>Bentonite</i>            | Extender                         | Contingency                          | Cement or Cement Additive  |
| <i>C-dye</i>                | Dye / soluble tracer of returns  | Primary                              | Cement or Cement Additive  |
| <i>Riser-Based Sections</i> |                                  |                                      |                            |
| <i>Bentonite</i>            | Viscosifying agent               | Contingency                          | WBM additive               |
| <i>Caustic soda</i>         | Alkalinity control               | Primary                              | WBM additive               |

| CHEMICAL                                   | FUNCTION                              | PRIMARY /<br>CONTINGENCY<br>CHEMICAL | CHEMICAL FUNCTION<br>GROUP |
|--------------------------------------------|---------------------------------------|--------------------------------------|----------------------------|
| <i>Soda ash</i>                            | water hardness control                | Primary/ Contingency                 | WBM additive               |
| <i>PAC UL</i>                              | Fluid loss control agent              | Primary                              | WBM additive               |
| <i>CMC HV</i>                              | Fluid loss control agent              | Contingency                          | WBM additive               |
| <i>PAC R</i>                               | Fluid loss control agent              | Primary                              | WBM additive               |
| <i>NaCl</i>                                | Salt - clay inhibition                | Primary                              | WBM additive               |
| <i>KCl</i>                                 | Salt - clay inhibition                | Contingency                          | WBM additive               |
| <i>Barite</i>                              | Weighting agent                       | Contingency                          | WBM additive               |
| <i>Defoamer</i>                            | Defoamer                              | Contingency                          | WBM additive               |
| <i>Lignosulphonate (CF)</i>                | Thinner / deflocculant                | Primary                              | WBM additive               |
| <i>XC Polymer</i>                          | Viscosifying agent                    | Primary                              | WBM additive               |
| <i>Modified starch</i>                     | Fluid loss control agent              | Primary                              | WBM additive               |
| <i>H<sub>2</sub>S Scavenger</i>            | H <sub>2</sub> S Scavenger            | Contingency                          | WBM additive               |
| <i>Magnesium oxide</i>                     | Alkalinity control                    | Contingency                          | WBM additive               |
| <i>Sized CaCO<sub>3</sub> (all grades)</i> | Bridging / Loss circulation material  | Primary                              | WBM additive               |
| <i>Granular Fibre (all grades)</i>         | Loss circulation material             | Contingency                          | WBM additive               |
| <i>Acid Soluble fibres</i>                 | Loss circulation material             | Contingency                          | WBM additive               |
| <i>Nutshell (all grades)</i>               | Loss circulation material             | Contingency                          | WBM additive               |
| <i>Graphite</i>                            | Lubricant / Loss circulation material | Contingency                          | WBM additive               |
| <i>Biocide</i>                             | Biocide                               | Contingency                          | WBM additive               |
| <i>Oxygen Scavenger</i>                    | Oxygen Scavenger                      | Contingency                          | WBM additive               |
| <i>Surfactant</i>                          | Surfactant                            | Contingency                          | WBM additive               |
| <i>Class G - Cement</i>                    | Cement G                              | Primary                              | Cement or Cement Additive  |
| <i>NF-6</i>                                | Antifoam                              | Primary                              | Cement or Cement Additive  |
| <i>Silicate Liq</i>                        | Extender                              | Primary                              | Cement or Cement Additive  |
| <i>HR-4</i>                                | Retarder                              | Primary                              | Cement or Cement Additive  |
| <i>KCl</i>                                 | Salt                                  | Primary                              | Cement or Cement Additive  |
| <i>Bentonite</i>                           | Extender                              | Contingency                          | Cement or Cement Additive  |
| <i>C- Dye</i>                              | Dye / soluble tracer of returns       | Contingency                          | Cement or Cement Additive  |
| <i>Tuned Spacer E+</i>                     | Spacer Viscosifier                    | Primary (spacer)                     | Spacer Chemical            |
| <i>Barite</i>                              | Weighting agent                       | Primary                              | Cement or Cement Additive  |
| <i>Halad-300L</i>                          | Fluid Loss Additive                   | Contingency                          | Cement or Cement Additive  |
| <i>Latex 4000</i>                          | Fluid Loss Additive                   | Contingency                          | Cement or Cement Additive  |
| <i>HR-4L</i>                               | Retarder                              | Contingency                          | Cement or Cement Additive  |

| CHEMICAL                     | FUNCTION             | PRIMARY /<br>CONTINGENCY<br>CHEMICAL | CHEMICAL FUNCTION<br>GROUP |
|------------------------------|----------------------|--------------------------------------|----------------------------|
| <i>SCR-100L</i>              | Retarder             | Contingency                          | Cement or Cement Additive  |
| <i>HALAD-344</i>             | Fluid Loss Additive  | Primary                              | Cement or Cement Additive  |
| <i>HALAD-413</i>             | Fluid Loss Additive  | Primary                              | Cement or Cement Additive  |
| <i>GasStop</i>               | Gas Control Additive | Primary                              | Cement or Cement Additive  |
| <i>Econolite</i>             | Extender             | Primary                              | Cement or Cement Additive  |
| <i>SA-1015</i>               | Suspension Agent     | Primary                              | Cement or Cement Additive  |
| <i>CFR-3</i>                 | Dispersant           | Primary                              | Cement or Cement Additive  |
| <i>Surfactant for spacer</i> | Surfactant           | Primary                              | Spacer Chemical            |

**Note:** Table 6-8 provides an indicative summary of the drilling-fluid, cementing and spacer chemicals included in the Chemical Use Plan (**Annex 05**). The complete product inventory, including product-specific functions, primary or contingency status, environmental classification and maximum estimated quantities, is provided in the CUP, which also includes chemicals not reproduced in Table 6-8.

### 6.7.1.2 Storage

The Igoumenitsa supply base will be used for the temporary storage of well equipment and supplies, including drilling tubulars, wellheads, and other drilling equipment. Onshore storage at the Igoumenitsa supply base will temporarily hold packaged sack chemicals and drilling consumables during the campaign. This inventory capacity is logistically required to ensure operational continuity, given the base's distance from regional oilfield infrastructure.

The types and quantities of materials stored at the Supply Base will remain within the limits and conditions established by the applicable port approvals and relevant Greek hazardous-material, fire-safety and environmental requirements. Packaged chemicals and other materials that present a potential release risk will be stored in designated areas with appropriate segregation and containment, considering their form, classification, and storage requirements.

No bulk liquid mud plant or permanent bulk chemical-storage facility will be established at the onshore logistics base. Limited quantities of packaged chemicals and drilling consumables may be temporarily stored in designated areas to support offshore operations. Drilling chemicals will otherwise be stored and managed primarily onboard the MODU in the applicable bulk-storage tanks and designated chemical and sack-storage areas.

The main storage areas onboard the MODU are the paint store, chemical store and sack store, all of which have closed drains and are banded.

Chemicals stored and used for general vessel operation and maintenance (e.g. cleaning agents, boiler chemicals, water treatment products, and general-purpose lubricants and greases) are not included in the offshore chemical use inventory. These materials are typically used in small quantities and are managed under the vessel's MARPOL-compliant waste and discharge control systems.

Deck washing and cleaning activities are controlled to minimise discharge to the marine environment, with preference for collection and treatment through the vessel's drainage systems where practicable, in accordance with MARPOL requirements.

The Paint Store only stocks chemicals used for vessel maintenance, which are not discharged, as summarised in Table 6-9.

**Table 6-9 – Paint Store Inventories**

| CHEMICAL  | AVERAGE CONTENT (LT) | TYPE                                                                   |
|-----------|----------------------|------------------------------------------------------------------------|
| Thinners  | 700                  | Sigma 21-06, 91-92, and 20-05                                          |
| Paint     | 3,600                | Various types supplied by Sigma/PPG (Sigmaprime, sigmacover, sigmadur) |
| Hardeners | 210                  | Parts A and B associated with the paint systems stored onboard         |

The Chemical Store primarily stocks chemicals used for vessel operations, including rust removers (approximately 200 L), boiler chemicals (approximately 500 L), potable-water dosing chemicals (approximately 300 L), phosphoric acid (approximately 150 L) and various cleaning chemicals.

The Sack Store is primarily used to store chemicals for Mud Engineers and Cementers, in accordance with the applicable well programme and CUP accepted for the Project.

Storage facilities and storage containers will meet GIIP. All onboard chemical storage is conducted in accordance with established procedures, including the availability and use of Safety Data Sheets, segregation of incompatible substances, appropriate labelling, and the implementation of spill prevention and secondary containment measures. Storage areas are routinely inspected and subject to inventory control.

## 6.7.2 Water Use

Water demand for the Project will be met primarily through direct seawater use and freshwater produced onboard using the MODU's desalination systems. Seawater will be abstracted directly from the surrounding marine environment and used for the preparation and mixing of drilling fluids and cement slurries, in line with standard offshore practice and with the objective of minimising the use of freshwater resources.

Potable and service water for domestic, sanitary and selected operational uses will be produced on board using the desalination systems described below.

The desalination system comprises two reverse osmosis (RO) units, providing operational flexibility and redundancy. Under normal operating conditions, RO systems are used for routine freshwater production. These systems function by pumping seawater at high pressure through semi-permeable membranes, which allow water to pass while retaining dissolved salts, thereby producing freshwater and a concentrated brine stream.

A thermal evaporator is also installed to supplement water production and provide backup capability. This system operates on the principle of distillation, in which seawater is heated under reduced pressure, causing it to evaporate at relatively low temperatures. The resulting vapour is condensed to produce distilled water, while salts and other dissolved substances remain in the residual brine. The evaporator system is less

sensitive to variations in feedwater quality and provides additional reliability of supply.

Freshwater produced onboard will be used for domestic, sanitary and selected operational purposes. The combined use of RO and evaporator systems ensures a reliable supply of freshwater for operational and domestic use throughout the campaign, while minimising reliance on external freshwater transport.

The use of seawater for drilling and cementing significantly reduces reliance on onshore freshwater supply. The direct use of seawater for drilling fluid preparation avoids the need to produce an estimated 23,000 m<sup>3</sup> of additional freshwater using the MODU's desalination systems or to supply that volume from shore. This estimate is based on the total make-up-water requirement in the current drilling-fluid programme

Seawater will be used for machinery cooling, ballast water operations and as feedwater for the onboard desalination systems. Deck washing may use freshwater or seawater, depending on operational requirements. Ballast water quantities represent temporary seawater uptake and transfer, as it is subsequently discharged in accordance with the vessel's Ballast Water Management Plan and applicable requirements. Cooling water is circulated through onboard machinery and returned directly to the marine environment.

**Table 6-10: Estimated water uses on the MODU**

| WATER USE                                | AVERAGE CONSUMPTION (M <sup>3</sup> /DAY) | PEAK CONSUMPTION (M <sup>3</sup> /DAY)                                                     | SOURCE              |
|------------------------------------------|-------------------------------------------|--------------------------------------------------------------------------------------------|---------------------|
| Cooling water intake                     | 90,080.0                                  | 97,760.0                                                                                   | Seawater            |
| Water maker feed (1 × condensate system) | 1,224.0                                   | 1,224.0                                                                                    | Seawater            |
| Water maker feed (2 × RO systems)        | 190.8                                     | 190.8                                                                                      | Seawater            |
| Ballast water uptake <sup>47</sup>       | 22.0                                      | Up to ca. 28,000 m <sup>3</sup> as a one-off discharge during deballasting for rig release | Seawater            |
| Domestic freshwater production           | 90.0                                      | 230.0                                                                                      | Produced onboard    |
| Sanitary use / grey water                | 70.5                                      | 70.5                                                                                       | Freshwater use      |
| Boiler                                   | 0.5                                       | 15.0                                                                                       | Freshwater use      |
| Deck washing                             | 5.7                                       | 8.0                                                                                        | Freshwater/Seawater |

As a contingency measure, and to ensure continuity of operations and crew welfare, provision is made for the temporary supply of up to approximately 6,000 barrels (approximately 954 m<sup>3</sup>) of potable water from shore facilities in the unlikely event of prolonged unavailability of the onboard desalination systems.

<sup>47</sup> Subject to deckload and fuel use. Estimated to be 22 m<sup>3</sup> per day. Additionally, up to 28,000 m<sup>3</sup> are required to ballast from 12 m drilling draft to 8.5 m transit draft at the end of the well.

## 6.7.3 Energy Consumption

### 6.7.3.1 Offshore Energy Consumption

Offshore energy use, including fuel consumption by the MODU, support vessels, and helicopter operations, represents the dominant source of energy demand.

Fuel consumption is dominated by power generation and dynamic positioning requirements of the MODU. The assessment for the MODU uses an indicative conservative fuel consumption of 43 tonnes of marine gas oil per day (t/day) during drilling and dynamic positioning support, equivalent to 50-52 m<sup>3</sup>/day at a density of 0.85-0.86 t/m<sup>3</sup>. “Standby” and “Peak Case” fuel consumption estimates (Table 6-11) illustrate operational variability.

**Table 6-11: MODU Estimated Fuel Consumption**

| CONDITION        | ACTIVITY                | ESTIMATED FUEL (T/DAY) |
|------------------|-------------------------|------------------------|
| Average Case     | Drilling / Routine DP   | 43                     |
| <b>Peak Case</b> | Storm / High Current DP | 53                     |
| <b>Standby</b>   | Non-drilling / Calm     | 25                     |

The 43 t/day rate represents the conservative average operating basis used to calculate campaign fuel consumption and emissions. The 53 t/day peak rate represents short-duration operation during more demanding dynamic-positioning conditions and is not assumed to persist throughout the campaign.

All support vessels will operate using Marine Gas Oil (MGO), or other compliant fuels with a maximum sulphur content of 0.10% m/m, in accordance with MARPOL Annex VI and the Mediterranean Sea SO<sub>x</sub> Emission Control Area requirements.

Helicopter fuel consumption is based on the Swiss FOCA/BAZL Guidance on the Determination of Helicopter Emissions, which provides methods and indicative factors for jet fuel combustion by helicopter type. The FOCA/BAZL methodology is widely used as a conservative screening level approach when confirmed aircraft specifications are unavailable. In the absence of confirmed aircraft type and final logistics planning at the ESIA stage, the helicopter fuel consumption assumption represents a conservative upper bound estimate pending confirmation of helicopter type, flight distance and rotation frequency.

Activity data and fuel consumption assumptions for each source are summarised in Table 6-12 for the 67-day drilling campaign.

**Table 6-12: Activity Data and Fuel Consumption**

| FUEL TYPE                                    | FUEL USE                | ACTIVITY BASIS                                           | FUEL/DAY (T) | CAMPAIGN DAYS | CAMPAIGN FUEL (T) |
|----------------------------------------------|-------------------------|----------------------------------------------------------|--------------|---------------|-------------------|
| <b>MGO (0.10% S, Med SO<sub>x</sub> ECA)</b> | MODU                    | DP drilling / hotel load / auxiliary offshore operations | 43           | 67            | 2,881             |
|                                              | Support vessels (total) | Combined operations of the two Project PSVs              | 25           | 67            | 1,675             |
|                                              |                         | <b>Total</b>                                             |              |               | <b>4,556</b>      |

| FUEL TYPE | FUEL USE   | ACTIVITY BASIS                                                                 | FUEL/DAY (T) | CAMPAIGN DAYS | CAMPAIGN FUEL (T) |
|-----------|------------|--------------------------------------------------------------------------------|--------------|---------------|-------------------|
| Jet A-1   | Helicopter | Crew-change / logistics flights.<br>~ 118 one-way flight sectors /<br>9,600 km | 2            | 67            | 134               |

**Note:** The support-vessel estimate applies a combined fuel-consumption allowance of 25 t/day for the 67-day offshore campaign. This allowance covers transit, manoeuvring, time at or near the MODU, port operations, and other operational periods for the two Project PSVs. It does not represent the fuel consumption of an additional dedicated standby vessel.

### 6.7.3.2 Onshore Energy Consumption

Onshore energy consumption is limited to logistical support activities at the Project's shore base at the Port of Igoumenitsa and the use of existing aviation infrastructure at Corfu International Airport (CFU) for personnel transfer. These activities are temporary in nature and do not involve industrial processing or continuous high-energy operations.

Shore base activities will primarily involve logistical support, storage, and the handling of materials and equipment, with no industrial processing or other energy-intensive activities. The principal sources of energy use will comprise:

- Electricity supplied from the existing port grid to support administrative and operational functions.
- Diesel fuel used for mobile equipment used for loading, unloading and material handling activities, including cranes, forklifts and heavy goods vehicles.

Shore base equipment will be used intermittently for lifting and transport during mobilisation, supply support and demobilisation, utilising standard mobile plant typical of port logistics operations.

Electricity demand at the shore base is expected to be low and largely associated with office and logistical support functions. Lighting requirements are expected to be met through existing port infrastructure, such that no significant additional energy demand for lighting is anticipated.

Reliance on existing port infrastructure avoids the need for additional on-site energy generation or temporary energy supply systems. Where practicable, equipment use will be planned and coordinated to minimise fuel consumption and avoid unnecessary idling.

Fuel consumption at the Supply Base will be associated with the operation of diesel-powered cargo handling, lifting and transport equipment used to support vessel loading and unloading activities, material storage, and general logistics operations. As the final equipment selection and utilisation rates will be determined during detailed operational planning, fuel consumption estimates are indicative and based on typical performance characteristics of equipment commonly used in offshore drilling logistics bases.

The principal sources of fuel consumption are expected to be forklifts used for cargo handling, heavy vehicles transporting equipment and materials to and from the port, and a mobile wharf crane utilised during vessel mobilisation and cargo transfer operations. Light-duty vehicles may also be used for personnel transportation and operational support activities within the port area.

Table 6-13 presents indicative average daily fuel consumption estimates based on representative equipment utilisation rates. Actual fuel consumption will vary depending on equipment specifications, operational schedules, load factors, maintenance condition and the frequency of vessel supply operations.

**Table 6-13: Indicative Average Daily Fuel Consumption of Shore Base Equipment**

| EQUIPMENT                           | ASSUMED UTILISATION | AVERAGE FUEL CONSUMPTION | FUEL CONSUMPTION (L/DAY) |
|-------------------------------------|---------------------|--------------------------|--------------------------|
| Forklift (11 t capacity)            | 6 h/day             | 10 L/h                   | 60                       |
| Forklift (16 t capacity)            | 6 h/day             | 15 L/h                   | 90                       |
| Prime mover with 40 ft semi-trailer | 100 km/day          | 40 L/100 km              | 40                       |
| Heavy-duty truck (40 t capacity)    | 100 km/day          | 35 L/100 km              | 35                       |
| 4×4 pick-up vehicle                 | 80 km/day           | 10 L/100 km              | 8                        |
| Wharf crane (160 t capacity)        | 4 h/day             | 30 L/h                   | 120                      |
| <b>Total</b>                        |                     |                          | <b>353</b>               |

Fuel consumption estimates are based on representative equipment operating hours, travel distances and fuel consumption rates for equipment typically used in port logistics. These values represent indicative average operating conditions<sup>48</sup>. These estimates represent average operational conditions. Fuel consumption may be temporarily higher during peak mobilisation, demobilisation or vessel turnaround activities and lower during periods of reduced logistics demand.

Given the temporary nature of the Project and the use of existing port infrastructure, fuel consumption associated with shore base activities is expected to be modest and localised. Refuelling and fuel handling activities will be undertaken in accordance with applicable port procedures and the Project's health, safety and environmental management requirements to minimise the risk of fuel spills and associated environmental impacts.

The Project's use of existing airport infrastructure at CFU will be limited to routine personnel transfers and is not expected to materially increase energy consumption at the facility. Airport operations are already supported by established electricity and fuel supply systems, and the scale and frequency of Project-related movements are low compared with overall airport activity. As the Project will utilise dedicated helicopter services operating from existing airport infrastructure, no additional infrastructure or dedicated energy supply will be required. Any associated energy use (e.g. terminal operations, ground handling, and refuelling) will form part of the airport's normal operational baseline.

## 6.8 Wastewater and Discharges

Operational discharges from the MODU and associated support vessels will be managed in accordance with MARPOL (Annexes I, IV and V), the International Convention for the Control and Management of Ships' Ballast Water and Sediments, and the corresponding EU, Greek and flag-state implementing requirements, in a

<sup>48</sup> (1) EEA, EMEP/EEA Air Pollutant Emission Inventory Guidebook 2023, Chapter 1.A.4 Non-road Mobile Machinery.

(2) IPCC 2006 Guidelines for National Greenhouse Gas Inventories, Volume 2 Energy.

(3) Manufacturer technical specifications (Kalmar DCG100–180 Forklifts (110–170 kW engines), Liebherr LHM 280/420 Mobile Harbour Cranes (~300–350 kW installed power), Volvo FH / Scania R-Series heavy-duty trucks).

manner consistent with Greece's obligations under the Barcelona Convention and its Offshore Protocol (Section 5.2.3.9).

In line with the Offshore Protocol's principles of pollution prevention, source minimisation, and use of best available techniques where practicable, operational discharges will be limited to those necessary for safe operations. These discharges will meet predefined quality criteria and be managed through engineering controls, documented procedures, and monitoring. Given the limited discharge volumes, treatment before release, and the offshore environment's high dilution and dispersion capacity, no significant adverse environmental effects are expected on the marine environment.

A maximum of 2 support vessels may operate in the operational area at any time. Each support vessel will typically carry 12 to 18 persons on board (POB). The MODU will not exceed 180 POB and will average 160 during the campaign.

## 6.8.1 Offshore Wastewater and Discharges

### 6.8.1.1 Bilge and Deck Drainage Water

Bilge water generated within machinery and equipment spaces, together with contaminated deck drainage arising from precipitation, sea spray, equipment washdown, maintenance activities and fire system testing, may contain traces of oil and other operational residues. On the MODU, bilge water discharges are estimated to average approximately 4.5 m<sup>3</sup>/day (approximately 302 m<sup>3</sup> over the 67-day campaign), with intermittent peak discharges of up to 20 m<sup>3</sup>/day depending on bilge holding tank levels and operational requirements (Table 6-15).

Bilge water collected from machinery spaces will be routed to dedicated bilge holding tanks and processed through an approved oily water separator (OWS) equipped with a certified oil content monitor and an automatic stop device. Treated bilge water may only be discharged through the designated discharge outlet at approximately 12 m below sea level when the oil content of the undiluted effluent does not exceed 15 mg/L (15 ppm) and all applicable MARPOL Annex I discharge conditions are met. If the discharge specification is not met, overboard discharge will be stopped and the effluent will be retained onboard for further treatment or transfer to an authorised port reception facility. All bilge water handling and discharge operations will be recorded in the Oil Record Book.

Potentially contaminated deck drainage from drilling and operational areas is routed to dedicated collection and treatment systems prior to discharge or offloading in accordance with applicable vessel management procedures.

For hydraulic assessment of the drainage system, a representative wet-weather rainfall depth of 85 mm over 24 hours gives approximately 314 m<sup>3</sup>/day of rainfall runoff from the assessed 3,690 m<sup>2</sup> deck area. A peak rainfall scenario of 140 mm over 24 hours gives approximately 517 m<sup>3</sup>/day. Including deck washing, the corresponding assessed daily drainage volumes are approximately 320 m<sup>3</sup>/day and 525 m<sup>3</sup>/day, respectively. These are peak drainage system loads calculated for a wet day and are not assumed to occur on a typical day of the drilling campaign. Total campaign drainage will depend on the cumulative rainfall occurring during the offshore campaign – see Table 6-15.

Discharges occur through designated drainage outlets located above or close to the waterline. Potentially contaminated drainage will be retained or treated through the applicable vessel systems before discharge.

In accordance with MARPOL Annex I, Greek implementing legislation and the Barcelona Convention Offshore Protocol, bilge and deck drainage discharges will be managed to prevent pollution through the application of approved treatment systems, operational controls, inspection and monitoring procedures.

### 6.8.1.2 Boiler blowdown

Boiler blowdown discharge volumes are based on periodic boiler maintenance requirements and assume a single blowdown event of approximately 15 m<sup>3</sup> per month. For assessment purposes, a conservative total campaign volume of 36 m<sup>3</sup> has been assumed, equivalent to an average of approximately 0.54 m<sup>3</sup>/day over the 67-day offshore campaign. This daily value is an averaging convention; the discharge will occur intermittently rather than continuously.

### 6.8.1.3 Ballast water

Ballast water is used to maintain vessel stability, trim and operational safety and is stored within dedicated ballast tanks segregated from machinery and oily water systems. The principal environmental consideration associated with ballast water management is the potential transfer of non-indigenous marine species. Ballast water management will be undertaken in accordance with the Ballast Water Management Convention and vessel-specific ballast water procedures.

During normal drilling operations, ballast water discharges from the MODU are estimated to average approximately 22 m<sup>3</sup>/day and a one-off ballast discharge of approximately 28,000 m<sup>3</sup> is anticipated at the completion of drilling activities to enable the vessel to transition from its operational drilling draught to its transit draught before departing the well location. Thus, ballast water total discharge volume is approximately 29,474 m<sup>3</sup> over the campaign (Table 6-15).

Ballast water management will be undertaken in accordance with the International Convention for the Control and Management of Ships' Ballast Water and Sediments (BWM Convention), relevant EU, Greek and flag-state requirements, and the pollution prevention objectives of the Offshore Protocol. The MODU and PSVs will implement approved Ballast Water Management Plans, maintain Ballast Water Record Books and utilise certified Ballast Water Treatment Systems (BWTS) designed to meet the D-2 ballast water performance standard. Ballast water exchange to the D-1 standard may be used only as a contingency measure, where permitted under the approved management plan.

Treated ballast water will be discharged through dedicated ballast outlets located approximately 1 m below sea level (Table 6-15). Under normal operating conditions, all ballast discharges will comply with the applicable organism concentration limits specified by the D-2 standard, thereby minimising the potential for introducing non-native species or pathogens into the marine environment. Any ballast water that becomes contaminated with oil or hazardous substances under abnormal circumstances will be managed as contaminated water and will not be discharged until compliance with the applicable regulatory requirements can be demonstrated.

#### 6.8.1.4 Cooling water

Cooling water is required for the operation of engines, thrusters, auxiliary machinery and other onboard systems. Seawater is continuously abstracted from the surrounding marine environment, circulated through non-contact cooling systems and discharged back to sea after heat exchange. Cooling water represents the largest operational discharge stream from the MODU, with an estimated average discharge volume of approximately 90,080 m<sup>3</sup>/day and a maximum discharge volume of approximately 97,760 m<sup>3</sup>/day, resulting in an estimated total discharge of approximately 6.0 million m<sup>3</sup> during the drilling campaign (Table 6-15).

Cooling water is discharged through multiple outlets located between approximately 6 m and 12 m below sea level, including dedicated outlets associated with engine room cooling systems, machinery cooling systems and thruster cooling systems (Table 6-15).

Cooling-water systems are designed to prevent contact with oils and contaminated process streams. The discharge comprises non-contact seawater containing any residual cooling-water treatment chemical at the applicable operational concentration.

The cooling-water system uses a marine-growth prevention treatment at the seawater intake. The treatment chemical and dosing arrangement will be managed in accordance with the applicable vessel's chemical management procedures and regulatory requirements. The product will be applied at the operational dosage required to maintain cooling-system performance.

Cooling water is expected to be discharged at temperatures only marginally above ambient seawater conditions. The discharged water will rapidly mix with surrounding seawater, resulting in highly localised and temporary thermal effects. Given the absence of contamination, the modest temperature differential and the substantial assimilative capacity of the receiving environment, cooling water discharges are not expected to cause significant adverse environmental impacts.

#### 6.8.1.5 Fire control water

Fire detection, fire suppression and emergency response systems are installed on the MODU and support vessels to maintain operational safety and compliance with applicable maritime regulations. Under normal operating conditions, firefighting systems do not generate routine discharges. However, periodic inspection, maintenance and testing activities, together with any emergency deployment of firefighting systems, may result in the discharge of firewater to the marine environment.

Firefighting foams and other fire-suppression agents will be selected and managed in accordance with the applicable regulatory requirements and the specifications and certification of the vessel's fire-protection systems. The use of firefighting agents during testing will be minimised where feasible without compromising system integrity, certification, or emergency readiness.

Routine testing activities will be planned and managed to minimise discharge volumes. Any significant emergency firewater release will be addressed under the Emergency Response Plan (ERP), which will be formally submitted to the regulatory authority(ies) for approval as required. This will also include the implementation of spill response and regulatory notification procedures, where required. Routine testing is expected to generate only limited firewater discharge. Potential releases associated with an emergency are considered within the accidental-events assessment.

### 6.8.1.6 Discharges from Evaporation and Desalination units

Freshwater requirements onboard the MODU are met through one evaporator system and two reverse osmosis (RO) desalination units. Operation of these systems generates concentrated brine streams that are discharged to sea after dilution in the vessel's cooling water systems.

The evaporator system is estimated to discharge approximately 1,174 m<sup>3</sup>/day of combined brine and cooling water, equivalent to approximately 78,658 m<sup>3</sup> over the campaign.

The two RO systems together are estimated to discharge approximately 237.6 m<sup>3</sup>/day, equivalent to approximately 15,919 m<sup>3</sup> over the campaign.

Brine from the evaporator is discharged through an outlet located approximately 5 m below sea level, while RO brine is discharged through an outlet located approximately 12 m below sea level (Table 6-15).

Consistent with the general pollution prevention objectives of MARPOL and applicable Greek environmental requirements, brine streams are segregated from oily and contaminated systems, and desalination system discharges are operationally managed and monitored to ensure they do not contain oil or other harmful substances at concentrations likely to cause pollution of the marine environment. Prior to discharge, brine is mixed with substantially larger volumes of cooling water, reducing salinity and enhancing dispersion. The resulting discharge enters an open offshore environment approximately 44 km from the nearest shoreline, where rapid dilution and mixing are expected to occur.

Given the relatively small increase in salinity following dilution, the large receiving water volume and the rapid dispersion characteristics of the discharge plume, desalination brine discharges are expected to result only in localised and temporary salinity elevations.

### 6.8.1.7 Sanitary wastewater and Greywater

Sanitary wastewater comprises blackwater (sewage) generated from toilets and sanitary facilities and greywater generated from accommodation areas, including showers, wash basins, laundries and galley facilities. Treated sewage discharge volumes represent the combined effluent from the forward (two units) and aft (one unit) sewage treatment plants. Based on a maximum accommodation level of approximately 180 persons on board (POB), treated sanitary wastewater discharges from the MODU are estimated at 20.5 m<sup>3</sup>/day, equivalent to approximately 1,371 m<sup>3</sup> over the campaign (Table 6-15).

Greywater discharges are estimated at 45 m<sup>3</sup>/day, equivalent to approximately 3,015 m<sup>3</sup> over the campaign.

Blackwater is collected and treated in IMO-approved sewage treatment plants prior to discharge through dedicated outlets located approximately 12 m below sea level. Treatment systems are operated in accordance with manufacturer specifications and certification requirements to ensure compliance with MARPOL Annex IV effluent standards. Where treatment systems are unavailable, or treatment standards cannot be achieved, sewage will be retained in holding tanks and discharged only when compliant conditions are restored or transferred to authorised shore reception facilities.

Greywater is discharged through dedicated outlets located approximately 12 m below sea level. It is routed through the final stage of the sewage treatment system for treatment and disinfection prior to discharge, in accordance with the applicable MARPOL Annex IV requirements.

### 6.8.1.8 Other liquid waste

Other liquid wastes generated during drilling operations include waste lubricating oils, hydraulic oils, spent chemicals, paint residues, collected spill residues, cooking oils and similar hazardous or non-routine liquid wastes. These materials are classified as non-dischargeable wastes and will not be intentionally released to the marine environment.

Liquid wastes will be minimised where practicable, segregated according to waste type, stored in dedicated labelled containers or tanks incorporating appropriate secondary containment, and transferred ashore to licensed waste contractors for treatment, recovery or disposal at authorised facilities. Waste management procedures will ensure full traceability from generation through to final treatment or disposal in accordance with the Project Waste Management Plan, MARPOL requirements and applicable Greek legislation. Consequently, no routine environmental discharges are associated with these waste streams.

### 6.8.1.9 Summary of Wastewater and Discharges

Non-drilling discharges from the MODU and PSVs are controlled through established shipboard pollution-prevention systems and procedures forming part of the vessel and operator's safety and environmental management systems, with performance limits aligned with MARPOL, the Mediterranean Special Area requirements, and national implementing legislation, as summarised in the following Table 6-14.

**Table 6-14 – Non-Drilling Discharge Streams**

| DISCHARGE STREAM                               | SOURCE / DESCRIPTION                                                                                   | TREATMENT / CONTROL MEASURE                                                                                                                                                                       | DISCHARGE LIMIT / PERFORMANCE STANDARD                                                                                                                                                                                                                                                                                                         | APPLICABLE CONVENTION / STANDARD / CONTROL BASIS                                                                                              |
|------------------------------------------------|--------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>Bilge water / oily deck drainage</i></b> | Oily mixtures from machinery spaces and any contaminated deck drainage on the MODU and support vessels | Collection in bilge tanks; processing through approved 15-ppm oily water separator (OWS) with oil content monitor and automatic stopping device; discharge conditions recorded in Oil Record Book | Discharge overboard only when the applicable MARPOL Annex I conditions are satisfied, and the oil content of the undiluted effluent does not exceed 15 mg/L. If the discharge criteria are not met, overboard discharge will be stopped, and the effluent retained for further treatment or transfer to an authorised port reception facility. | MARPOL Annex I, Regulation 15 (control of discharge of oil); approved 15-ppm oily water filtering equipment and Oil Record Book requirements. |

| DISCHARGE STREAM                                             | SOURCE / DESCRIPTION                                                                                        | TREATMENT / CONTROL MEASURE                                                                                                                                                                                                                                                                                                         | DISCHARGE LIMIT / PERFORMANCE STANDARD                                                                                                                                                                                                                                                                                                         | APPLICABLE CONVENTION / STANDARD / CONTROL BASIS                                                                                                                                                                                |
|--------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Ballast water</b>                                         | Seawater used in ballast tanks on the MODU and support vessels                                              | Implementation of an approved Ballast Water Management Plan; use of a certified Ballast Water Treatment System (BWTS) to meet the D-2 standard for ballast water discharges, with D-1 open-ocean exchange retained only as a contingency method where applicable; all ballast operations recorded in the Ballast Water Record Book. | Under normal operations, ballast water discharged only after treatment to meet the D-2 performance standard for living organisms; in exceptional circumstances, sequential ballast-water exchange to the D-1 standard may be used as a contingency measure in approved offshore areas, in line with the vessel's Ballast Water Management Plan | BWM Convention Regulations B-1, D-1, D-2 and D-3; approved Ballast Water Management Plan and Ballast Water Record Book.                                                                                                         |
| <b>Cooling water (non-contact)</b>                           | Non-contact cooling water from engines, thrusters and auxiliary systems                                     | Non-contact cooling system segregated from oily and contaminated drains; marine growth prevention treatment addressed below.                                                                                                                                                                                                        | Discharged as clean, non-oily water with no visible sheen, discoloration or floating solids; must not contain oil or harmful substances in quantities that would cause pollution                                                                                                                                                               | MARPOL general pollution-prevention obligation (Annex I/ Convention articles) for discharges free of oil and harmful substances; Greek environmental legislation on discharges free of oil/harmful substances.                  |
| <b>Cooling water with marine-growth-prevention treatment</b> | Seawater systems, including desalination pre-treatment, where biocides or corrosion inhibitors may be dosed | Treatment chemical applied at the operational dosage required to maintain cooling-system performance and managed under the applicable vessel chemical-management and regulatory requirements.                                                                                                                                       | Residual concentrations of biocides/additives in discharge kept within manufacturer, flag-state and permit-defined limits and at levels not expected to cause harmful effects; no visible pollution at discharge                                                                                                                               | Barcelona Convention Offshore Protocol; UNEP/MAP Common Standards and Guidelines for the Use and Disposal of Drilling Fluids and Cuttings and offshore chemicals in the Mediterranean; operator chemical management procedures. |

| DISCHARGE STREAM                                                | SOURCE / DESCRIPTION                                                                                                                                                                     | TREATMENT / CONTROL MEASURE                                                                                                                                                   | DISCHARGE LIMIT / PERFORMANCE STANDARD                                                                                                                                                                                                                      | APPLICABLE CONVENTION / STANDARD / CONTROL BASIS                                                                                                                                                |
|-----------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Stena DrillMAX Desalination brine (1 evaporator + 2 ROs)</b> | Concentrated brine/reject from a thermal evaporator and two reverse osmosis plants producing freshwater                                                                                  | Brine kept segregated from oily and chemical systems; no deliberate addition of oil or harmful substances; operational controls minimise any pre-treatment chemical residuals | Discharged locally at the rig as a clean, high-salinity stream without oil or added harmful substances; expected rapid dispersion at open-sea location (~44 km from closest shoreline); no visible pollution                                                | MARPOL general pollution-prevention obligation for discharges that do not contain oil or harmful substances; Greek environmental legislation for discharges free of oil and harmful substances. |
| <b>Treated sewage</b>                                           | Blackwater from toilets and sanitary facilities; greywater from showers, wash basins, laundries and galley facilities is treated through the final stage of the sewage-treatment system. | Collection in sewage system; treatment in IMO-approved sewage treatment plant operated in accordance with its certificate; discharges logged in Sewage Record / PMS           | Discharge of treated sewage permitted only when the approved plant is operating and effluent quality meets IMO performance standards and flag-state criteria; otherwise retained on board for shore reception                                               | MARPOL Annex IV (sewage); IMO performance standard for sewage treatment plants; International Sewage Pollution Prevention Certificate / equivalent flag-state certification.                    |
| <b>Untreated / non-compliant sewage (contingent)</b>            | Sewage in case of treatment plant unavailability or non-compliance                                                                                                                       | Diversion to holding tanks; no planned overboard discharge; transfer to shore reception facilities at first opportunity                                                       | No routine discharge of untreated or non-compliant sewage; any exceptional discharge only under MARPOL Annex IV conditions (vessel en route, sufficient distance from land, moderate rate, Administration approval)                                         | MARPOL Annex IV, discharge conditions for untreated sewage; vessel sewage management procedures and holding-tank arrangements.                                                                  |
| <b>Waste oils, spent chemicals and liquid hazardous wastes</b>  | Lube and hydraulic oils, spent chemicals, paint residues, collected small spills and similar                                                                                             | Collection in dedicated tanks/containers; labelling and secure storage; transfer to licensed onshore waste contractors; no shipboard treatment for sea discharge              | No planned discharge to sea. These waste streams will be retained onboard and transferred ashore to authorised recovery, treatment or disposal facilities. Accidental releases are addressed through the spill-response and accidental-events arrangements. | MARPOL Annex I and Annex V prohibitions on disposal of oil and harmful substances at sea; Greek hazardous-waste legislation; company waste-management standards.                                |

**Note:** Greywater is routed through the final stage of the sewage-treatment system for treatment and chlorine disinfection before discharge. Greywater quantities are reported separately in Table 6-15.

Firewater discharges may occur during system testing or emergency response. Such discharges are infrequent and managed under the Project's emergency response procedures and chemical management systems, with notification and reporting as required.

Operational discharges from the MODU and support vessels are managed in accordance with established pollution-prevention and environmental management systems, consistent with applicable international and national requirements. Indicative discharge quantities, controls and applicable standards are summarised in Table 6-15.

Table 6-15: Summary of MODU Discharges

| NO. | DISCHARGE STREAM                 | SOURCE / DESCRIPTION                       | TREATMENT / CONTROL MEASURE                                       | DISCHARGE LIMIT / PERFORMANCE STANDARD                                       | AVG. ## 6.8.2 Onshore Wastewater

Sanitary facilities for shore base personnel will be provided by portable chemical toilets within the designated operational area of the Supply Base. The facilities will serve the small onshore workforce, expected to comprise up to six personnel during routine operations. The chemical toilets will be supplied, maintained and serviced by a licensed contractor at regular intervals to ensure hygienic conditions and adequate capacity. Waste collected from the units will be removed and transported to an authorised facility for treatment or disposal, as applicable, in accordance with national regulations and port requirements. Given the limited number of personnel and the temporary nature of the activity, wastewater volumes generated from these facilities are expected to be minor.

## 6.9 Waste and Discharges

### 6.9.1 Offshore Waste and Discharges

#### 6.9.1.1 Drilling Waste and Discharges

##### 6.9.1.1.1 Drill Cuttings and Drilling Discharges

Drilled cuttings will have 6-15% coating of drilling fluid; all well sections will use water-based mud (WBM). Although the UNEP/MAP Common Standards and Guidelines permit low-toxicity NADF in deeper sections with strict discharge controls, NADF will not be used or discharged for Asopus-1.

The drilling-fluid components are included in the Chemical Use Plan (CUP). Chemicals in the CUP are included to support specific drilling-fluid functions, including well-pressure control, wellbore stability, inhibition, viscosity, fluid-loss control and management of the temperature and geological conditions encountered during drilling. The CUP includes chemicals proposed for planned use and contingency chemicals that will be used only if required by the well conditions encountered. The inclusion of a chemical in the CUP does not necessarily mean it will be used.

Table 6-18 summarises anticipated discharges of drilling fluid and cuttings. The quantities are based on the current well design and drilling-fluid programme. The final well design and mud and cement programmes will be confirmed before drilling through the applicable well-planning and regulatory processes.

##### 6.9.1.1.1.1 Riserless Section – Seawater and WBM

Seawater combined with high-viscosity gel sweeps will serve as the drilling fluid for the initial conductor jetting and 26-in surface-hole section, with discharge at the seabed. The gel sweeps will contain water-based additives required to provide the necessary viscosity and fluid properties during riserless drilling. Cuttings and water-based drilling fluids will be discharged at the seabed during the riserless sections. Up to

approximately 490 tonnes of claystone and calcareous cuttings and approximately 1,318 tonnes of drilling fluids will be discharged during top-hole drilling (Table 6-18).

The riserless drilling fluids will comprise predominantly seawater, with water-based additives to provide the required viscosity, inhibition, and fluid-control properties. The planned additives include salts and water-soluble polymers. Weighting and viscosifying materials identified as contingency products in the CUP, including barite and bentonite, may be used only if required by the encountered drilling conditions. Product-specific compositions, primary or contingency status and maximum estimated quantities are provided in the CUP.

The discharge of WBM and cuttings at the seabed during the riserless sections has been assessed against the applicable requirements of the Barcelona Convention Offshore Protocol and relevant UNEP/MAP standards and guidelines.

#### 6.9.1.1.1.2 Risered Section – WBM

After completing the riserless sections, a marine riser and a blowout preventer (BOP) stack are installed to connect the well to the MODU and enable a closed-circulating system. The MODU's primary solids control equipment, including shale shakers and a centrifuge, removes cuttings from mud before recirculating the fluid back to the well.

Intermediate and target-hole sections will be drilled with water-based mud. Different shaker screen mesh sizes will be installed to remove specific particle sizes, thereby optimising drilling fluid properties.

Under normal operating conditions, cuttings associated with WBM are not expected to contain hydrocarbons at levels that would make them unsuitable for discharge and will be discharged in accordance with the applicable regulatory requirements. Discharged cuttings typically range from very fine particles of approximately 20 µm to coarse fragments of less than approximately 1 cm in diameter, following separation from the drilling fluid. The rate of cuttings discharge generally decreases with increasing well depth due to progressively smaller hole diameter and changes in penetration rate. Discharge will be intermittent because active drilling will not occur continuously while the MODU is on location.

Cuttings are discharged 12 m below the water line, while drilling mud is recirculated. For the base-case well design, up to 453 tonnes of calcareous and carbonate-based cuttings and 1,158 tonnes of drilling fluids may be discharged on the well sections drilled with a riser in place. A further discharge of 1,312 tonnes of drilling fluid may be conducted during the well plug and abandonment process (Table 6-18).

Drilling returns will be monitored through LWD, mudlogging and routine observation of the returned cuttings and drilling fluid. An LWD indication of a potentially hydrocarbon-bearing interval will inform monitoring and operational decision-making but will not, by itself, establish that the returned cuttings are contaminated with hydrocarbons. Where cuttings or drilling returns are identified as contaminated with reservoir hydrocarbons in concentrations that make them unsuitable for discharge under applicable requirements, discharge of the affected material will cease. The affected cuttings and fluids will be contained onboard and transferred ashore for management at an authorised facility.

Actual discharge quantities may vary depending on the final well depth and the drilling conditions encountered. The contingency envelope includes potential additional WBM and cuttings associated with lost

circulation, wellbore washout, re-spudding, sidetracking, re-drilling of individual sections and contingency casing strings. The estimated contingency quantities are presented separately in Table 6-19.

Table 6-16 – Estimated Drilling Fluids and Cuttings Discharges withing the Operational Area

|                                                                                 | Discharges while Drilling (continuous)                  |                     |                                  |                         |                    | Batch Discharge of WBM at End of Sections |                             |                                           |                                           |

| TOTAL                                                                           |                                                         |                     |                                  | 942.5                   | 1574.6             |                                           |                             | 280                                       | 1933.4                                    |

**Notes:** WBM = water-based mud, PAD = pump-and-dump mud, which is a type of water-based mud.

#### 6.9.1.1.2 Cementing discharges

The 36-in conductor will be jetted in without cementing. A 20-in surface casing string will then be installed and cemented using approximately 336 m<sup>3</sup> of slurry in the 26-in hole, with sufficient excess cement. Most of the slurry will remain within the casing–formation annulus. Cement returns to the seabed may occur during cementing of the surface casing.

For subsequent cementing operations, fluids will be returned to the MODU through the riser, as follows:

- The 13-5/8-in intermediate casing will be cemented. The anticipated top of cement is approximately 300 m below the 20-in casing shoe. Cement slurry will remain within the wellbore unless circulation or remedial action is required.
- The 9-5/8-in intermediate liner will be cemented, with the top of cement anticipated at the liner top. Residual cement and fluids containing cement above the liner top may be circulated to the MODU. Following treatment and management onboard, limited discharge may occur in accordance with applicable requirements. Cleaning the cementing unit may result in a further discharge. The total estimated routine surface discharge is approximately 15 m<sup>3</sup>.
- P&A may generate up to approximately 24 m<sup>3</sup> of cement or cement-contaminated fluid requiring management and discharge from the MODU (Table 6-18).

If a cementing operation must be terminated because of equipment failure, blocked lines or another operational problem, up to approximately 48 m<sup>3</sup> of cement slurry or cement-contaminated fluid may require discharge from the MODU. This represents a contingency case and is not part of the planned base-case discharge (Table 6-19).

#### 6.9.1.1.3 Pipe dope

Pipe dope (also referred to as thread compound) is a lubricating and sealing compound applied to threaded connections on drill pipe, casing and other tubulars during make-up and break-out operations. Its primary purpose is to reduce friction and galling, provide corrosion protection and help ensure pressure-tight connections during drilling operations.

The Project will use commercially available thread compounds selected in accordance with the Project's chemical management procedures (including review of Safety Data Sheets).

These compounds are classified as non-discharged chemicals during normal operations. However, minor incidental losses to the marine environment may occur, such as wash-off from the rig floor during cleaning or rainfall, or limited transfer to the wellbore during tripping.

Controlled application and good housekeeping practices will be used to minimise excess thread compound and incidental losses. Waste thread compound, contaminated materials and empty containers will be collected and transferred ashore as waste in accordance with the Project Waste Management Plan (Annex 04).

#### 6.9.1.1.4 BOP Discharges

Following installation, operation and testing of the subsea BOP, diluted hydraulic-control fluid may be released at the seabed. The hydraulic-control fluid is Stack Magic Eco V2, mixed with potable water at approximately 4.5% Stack Magic and 95.5% water by volume.

Planned operations are estimated to discharge approximately 21.2 m<sup>3</sup> of diluted hydraulic-fluid mixture. Including the assessed contingency operations, the maximum campaign total is approximately 42.9 m<sup>3</sup>, comprising approximately 40.97 m<sup>3</sup> of water and 1.93 m<sup>3</sup> of Stack Magic Eco V2 (Table 6-17). The maximum campaign total is equivalent to approximately 0.64 m<sup>3</sup>/day when averaged over 67 days; actual releases will occur intermittently rather than as a continuous daily discharge. A single rigid-conduit release may be up to approximately 18 m<sup>3</sup>. The discharge is conveyed through a pipe with a diameter of DN12 and is released at seabed level.

**Table 6-17: Estimation of BOP discharges**

| FUNCTION              | VOLUME (L) | FREQUENCY     |             | TOTAL VOLUME PER WELL (L) |               |                     |               |              |
|-----------------------|------------|---------------|-------------|---------------------------|---------------|---------------------|---------------|--------------|
|                       |            | Planned       | Contingency | Planned                   | Contingency   | Total               |               |              |

Stack Magic Eco V2 is water-soluble and biodegradable. At the assessed dilution of approximately 4.5%, operational releases will consist predominantly of water and will disperse after release from the subsea BOP system. The potential effects of the planned and contingency releases are assessed using the product characteristics, discharged quantity, dilution and receiving-environment conditions. The releases are expected to be localised and short-term.

#### 6.9.1.1.5 Summary of Drilling Discharges

Table 6-18 summarises the anticipated drilling discharges. It should be noted that seawater may also be discharged throughout the drilling process. Table 6-19 presents scenario-specific contingency discharges.

The discharge quantities presented in this section represent conservative upper-bound estimates based on the assessed design envelope. Actual discharge volumes may vary depending on final well design, drilling conditions and operational requirements.

**Table 6-18: Estimated Base-Case Drilling Discharges**

| DISCHARGE TYPE                                                                                | TYPICAL MAXIMUM QUANTITY                                                                                                                                                                                                                                                                             |
|-----------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Drilling Cuttings – Seabed Discharge <sup>49</sup>                                            | 189 m <sup>3</sup> / 490 tonnes                                                                                                                                                                                                                                                                      |
| Drilling Cuttings – Discharge 12m below sea level                                             | 174 m <sup>3</sup> / 453 tonnes                                                                                                                                                                                                                                                                      |
| Water-based Mud – Seabed Discharge                                                            | 1,156 m <sup>3</sup> / 1,318 tonnes                                                                                                                                                                                                                                                                  |

| Cement Slurry Surface Discharges from Residuals, e.g., testing, line flushing, excess volumes | 15 m <sup>3</sup> / 28 tonnes                                                                                                                                                                                                                                                                        |
| BOP Installation and Function Testing                                                         |                                                                                                                                                                                                                                                                                                      |
| BOP Hydraulic Fluids<br>Releases occur intermittently at seabed level.                        | Approximately 21.2 m <sup>3</sup> of diluted hydraulic-control fluid from planned operations.<br>The maximum planned-plus-contingency campaign envelope is approximately 42.9 m <sup>3</sup> , comprising approximately 40.97 m <sup>3</sup> of water and 1.93 m <sup>3</sup> of Stack Magic Eco V2. |
| Well P&A                                                                                      |                                                                                                                                                                                                                                                                                                      |
| Contaminated Cement Surface Discharge                                                         | 24 m <sup>3</sup> / 45 tonnes                                                                                                                                                                                                                                                                        |
| Non-displaced wellbore content                                                                | Left inside the well                                                                                                                                                                                                                                                                                 |
| Water-based Mud inside wellbore and riser before displacing to Seawater – Surface Discharge   | 1,150 m <sup>3</sup> / 1,312 tonnes                                                                                                                                                                                                                                                                  |

**Table 6-19: Drilling Discharges during contingency operations**

| CONTINGENCY ACTIVITIES                                                          | TYPICAL MAXIMUM QUANTITY | DISCHARGE AREA                     |
|---------------------------------------------------------------------------------|--------------------------|------------------------------------|
| Cuttings – Well re-spud (riserless / riser in place), m <sup>3</sup>            | 152                      | Seabed / From MODU below sea level |
| Cement – Well re-spud (riserless / riser in place), m <sup>3</sup>              | 35                       | Seabed / From MODU below sea level |
| Cuttings – Sidetrack <sup>1</sup> (riser in place), m <sup>3</sup>              | 174                      | From MODU below sea level          |
| Cuttings – Emergency Disconnect <sup>2</sup> (riser in place), tonnes           | 12.4                     | Seabed                             |
| WBM fluids - Emergency Disconnect <sup>2</sup> (riser in place), m <sup>3</sup> | 174                      | Seabed                             |
| Failed cement job / cement contamination (riser in place)                       | 48 m <sup>3</sup>        | From MODU below sea level          |

<sup>49</sup> Drilling returns will be monitored through LWD, mudlogging and observation of the returned cuttings and drilling fluid. Where cuttings or drilling returns are identified as contaminated with reservoir hydrocarbons such that they are unsuitable for discharge under the applicable requirements, discharge of the affected material will cease and it will be contained onboard for transfer ashore.

| CONTINGENCY ACTIVITIES                           | TYPICAL<br>MAXIMUM<br>QUANTITY | DISCHARGE AREA            |
|--------------------------------------------------|--------------------------------|---------------------------|
| Contingent Cementing Operations (riser in place) | 60 m <sup>3</sup>              | From MODU below sea level |

**Notes:** <sup>1</sup> Indicative based on a 12-1/4-inch sidetrack hole. The quantities represent scenario-specific upper-bound estimates. They are not expected to occur routinely and should not be summed as a single combined contingency discharge unless the underlying scenarios can occur cumulatively.

<sup>2</sup> Emergency-disconnect quantities represent the estimated riser contents released during the same assessed EDS event. Actual quantities will depend on the drilling phase and the contents of the riser when disconnection occurs.

### 6.9.1.2 MSW

Municipal solid waste (MSW) will be generated onboard the MODU and PSVs as a result of routine accommodation, catering, maintenance and operational activities. Waste streams are expected to include general domestic waste, paper and cardboard, plastics, metals, electrical and electronic waste, packaging materials and used cooking oil. Based on anticipated personnel levels and historical operational data, estimated waste generation during the drilling campaign includes approximately 1,200 kg of general non-recyclable waste, 1,520 kg of paper, wood and cardboard, 56 kg of plastics, 2,350 kg of metals, 375 kg of electrical waste and 75 kg of used cooking oil.

In accordance with MARPOL Annex V, the Mediterranean Sea Special Area requirements, Greek implementing legislation and the pollution prevention objectives of the Barcelona Convention Offshore Protocol, the discharge of plastics and other municipal or operational garbage to sea is prohibited, and other municipal and operational wastes will be retained onboard except where a specific discharge is permitted under MARPOL Annex V, as described for food waste in Section 6.9.1.3.

All MSW will therefore be managed under the vessel's approved Garbage Management Plan, with waste segregation undertaken at source to maximise opportunities for recycling, recovery and appropriate treatment. Waste materials will be collected in designated, clearly labelled containers, compacted where appropriate, and stored in enclosed waste handling areas to prevent littering, odour generation, and accidental loss to the marine environment.

All municipal and operational solid waste, including plastics, paper, cardboard, metals, packaging materials, waste electrical equipment, and used cooking oil, will be retained on board and transferred to authorised shore reception facilities via the project logistics chain. Waste will subsequently be managed by licensed waste contractors in accordance with applicable waste management regulations and the Project Solid Waste Management Plan (SWMP). No processing of these waste streams for overboard disposal will occur.

All waste transfers will be documented through the vessel's waste tracking procedures, including maintenance of the Garbage Record Book, to ensure traceability from generation through to final treatment or disposal. Personnel will receive appropriate training in waste segregation, storage and pollution prevention measures to minimise the risk of accidental releases to the marine environment.

### 6.9.1.3 Food waste

Food waste will be generated primarily from galley and catering activities associated with accommodation facilities onboard the MODU. Based on historical data from comparable drilling campaigns (1.05 kg per person per day, maximum 1.16 kg/person per day) and a maximum accommodation level of 180 persons on board (POB), food waste generation is estimated at approximately 189 kg/day, with a maximum generation rate of approximately 209 kg/day, resulting in an estimated total of approximately 12.7 tonnes over the 67-day drilling campaign.

Food waste will be managed in accordance with the vessel's Garbage Management Plan, MARPOL Annex V, the Mediterranean Sea Special Area provisions and applicable Greek regulatory requirements. Food waste will be segregated from other waste streams at the source and managed to prevent contamination by plastics, packaging materials, or other non-food waste. Where discharge is permitted under MARPOL Annex V requirements, food waste will first be macerated to a particle size of 25 mm or less and discharged only where the MODU is located beyond the applicable minimum distance from the nearest land. Discharges will occur through the vessel's dedicated food waste discharge system, located approximately 12 m below sea level.

Food waste may be discharged where the applicable MARPOL Annex V conditions are met. Where compliant discharge is not available or operationally practicable, food waste will be retained onboard and transferred to an authorised shore reception facility.

Given the biodegradable nature of food waste, the relatively small quantities involved compared with the receiving marine environment, compliance with MARPOL Annex V discharge requirements and the offshore location of drilling activities, significant adverse environmental effects from food waste management are not anticipated.

### 6.9.1.4 Hazardous Waste

Hazardous waste generated during drilling operations will primarily comprise machinery sludge, contaminated oil wastes, paints and solvents, and chemical wastes associated with maintenance and offshore drilling activities.

**Table 6-20: Hazardous waste streams during drilling operations**

| HAZARDOUS WASTE STREAM        | DESCRIPTION                                                                                                                                                                            | ESTIMATE D QUANTITY    | MANAGEMENT METHOD                                                                                    |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------|------------------------------------------------------------------------------------------------------|
| <b>Sludge</b>                 | Oily sludge generated from machinery spaces, fuel purification systems, bilge water treatment, and maintenance activities                                                              | 3 m <sup>3</sup> /week | Collected and transferred to licensed onshore waste management facilities for treatment and disposal |
| <b>Oil contaminated waste</b> | Oil-contaminated absorbents, used filters, empty chemical or lubricant containers, contaminated hoses, and maintenance materials containing hydrocarbons or lubricants                 | 480 kg/week            | Segregated, stored onboard, and transferred to licensed onshore facilities for recovery or disposal  |
| <b>Paints and solvents</b>    | Residual marine coatings, epoxy and anti-corrosion paints, paint thinners, cleaning solvents, degreasers, contaminated paint containers generated during vessel maintenance activities | 150 kg/week            | Stored in designated hazardous waste areas and transferred to licensed onshore facilities            |

| HAZARDOUS WASTE STREAM | DESCRIPTION                                                                                                                                                                             | ESTIMATED QUANTITY | MANAGEMENT METHOD                                                                         |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------|-------------------------------------------------------------------------------------------|
| Chemical waste         | Spent, contaminated or unusable drilling chemicals, mud additives, cement additives and maintenance chemicals; waste hydraulic fluids, detergents and contaminated chemical containers. | 750 kg/week        | Collected separately and transferred to licensed onshore treatment or disposal facilities |

The quantities presented are indicative weekly generation estimates based on comparable vessel operations. Actual quantities will depend on maintenance activities, chemical use and operational conditions. Waste will be classified according to its composition and applicable waste-classification requirements before transfer ashore.

Hazardous waste will be segregated, temporarily stored in designated onboard storage areas, and transferred to licensed onshore waste management facilities for treatment, recovery, or disposal in accordance with applicable national and international waste management requirements.

## 6.9.2 Onshore Waste

Onshore activities will be limited to logistical support at the Project's shore base at the Port of Igoumenitsa, including storage, vessel support, and coordination activities. No industrial or maintenance works are planned at the shore base.

Waste received at the shore base will be temporarily stored in designated areas prior to transfer to licensed contractors, in accordance with site procedures and regulatory requirements for storage, handling and segregation.

Waste quantities are driven by logistical handling, storage and packaging activities and are consistent with the aggregated phase-based estimates presented in Table 6-21. Total quantities are based on indicative weekly generation rates, scaled to the project phase durations (mobilisation, drilling, and demobilisation).

At the onshore logistics base, a maximum of six personnel is expected to be present during operational activities. Municipal waste generated from routine office and welfare activities, including food packaging, paper products and general housekeeping waste, is conservatively estimated at approximately 10–12 kg/day. These wastes will be managed through the port's established waste management systems, including segregation, temporary storage and transfer to authorised waste management contractors for recycling, recovery or disposal.

All onshore wastes will be managed through the shore base waste management system and transferred to authorised facilities. Table 6-21 presents the waste expected to be generated by temporary shore-based logistics and welfare activities. It excludes waste generated offshore and backloaded through the Supply Base, which is reported separately in Sections 6.9.1.2–6.9.1.4. Backloaded offshore waste will be temporarily staged at the Supply Base but will not be counted again as onshore-generated waste.

Table 6-21: Estimated Non-Hazardous Waste

| WASTE STREAM                     | INDICATIVE WEEKLY GENERATION RATE (KG/WEEK) |                    |                | ESTIMATED TOTALS (KG)  |                              |                 |
|----------------------------------|---------------------------------------------|--------------------|----------------|------------------------|------------------------------|-----------------|
|                                  | MOBILISATION                                | OPERATIONS SUPPORT | DEMobilISATION | MOBILISATION (8 WEEKS) | OPERATIONS SUPPORT (67 DAYS) | DEMOB (8 WEEKS) |
| <i>General non-recyclable</i>    | 60                                          | 135                | 60             | 480                    | 1,290                        | 480             |
| <i>Paper, wood and cardboard</i> | 76                                          | 171                | 76             | 610                    | 1,640                        | 610             |
| <i>Plastic</i>                   | 5.6                                         | 8.4                | 5.6            | 45                     | 80                           | 45              |
| <i>Metal</i>                     | 117.5                                       | 176.3              | 117.5          | 940                    | 1,690                        | 940             |
| <i>Food waste</i>                | 28                                          | 63                 | 28             | 220                    | 600                          | 220             |
|                                  |                                             |                    | <b>Total</b>   | <b>2,300</b>           | <b>5,300</b>                 | <b>2,300</b>    |

## 6.10 Air emissions

Atmospheric emissions from the Project will primarily arise from fuel combustion by the MODU, support vessels, helicopters and other equipment used during operations. The main emissions are expected to be nitrogen oxides (NO<sub>x</sub>), sulphur oxides (SO<sub>x</sub>), carbon monoxide (CO) and particulate matter (PM), as well as greenhouse gases, including carbon dioxide (CO<sub>2</sub>), methane (CH<sub>4</sub>) and nitrous oxide (N<sub>2</sub>O).

The Stena DrillMAX is a DP3 ultra-deepwater drillship equipped with six Wärtsilä 16V32 diesel engines. These engines are certified to IMO Tier I NO<sub>x</sub> standards and are subject to routine inspection and maintenance in accordance with applicable statutory and class requirements. Emergency generators and lifeboat engines are excluded from the emissions inventory as they operate only under emergency or non-routine conditions and do not materially contribute to normal operational emissions.

No well test is planned as part of the Asopus-1 drilling programme. Accordingly, venting and flaring associated with well testing, hydrocarbon disposal or routine flare operations are not included within the planned project scope. Emissions management will therefore focus on combustion-source emissions, supported by optimised well design, a short drilling campaign, efficient power generation, logistics optimisation and preventative maintenance.

### 6.10.1 Air Emissions from Offshore Drilling Operations

#### 6.10.1.1 Regulatory Controls

Atmospheric emissions from the Project will be managed in accordance with the applicable Greek, European Union and international regulatory framework, including Law 4409/2016, MARPOL Annex VI and other relevant environmental and offshore regulatory requirements. In Greece, offshore upstream activities are regulated through the national hydrocarbons and environmental permitting framework under the oversight of the competent authorities and HEREMA.

The Mediterranean Sea Sulphur Emission Control Area came into effect on 1 May 2025 and requires ships operating in the area to use fuel with a sulphur content not exceeding 0.10% m/m. The MODU and support vessels will comply with these requirements by using compliant fuel and established fuel management and verification procedures.

The Stena DrillMAX, built in 2007, is subject to IMO Tier I NOx requirements under MARPOL Annex VI, Regulation 13. These requirements apply to qualifying marine diesel engines installed on ships constructed on or after 1 January 2000 and before 1 January 2011. The Mediterranean Sea Emission Control Area that entered into effect on 1 May 2025 applies to sulphur oxides and particulate matter and does not impose NOx Tier III requirements. Accordingly, the Stena DrillMAX remains subject to the applicable Tier I NOx requirements.

Atmospheric emissions for the project have been estimated according to International Maritime Organisation (IMO) guidance, using Stena DrillMAX's expected operating conditions, fuel consumption as calculated in Section 6.7.3.1, and the planned 67-day campaign. The assessment covers routine activities and includes combustion emissions from the MODU, support vessels, helicopter transfers, and ancillary equipment. Emission calculations take into account the specific fuels, engine certifications, and regulatory context of the Asopus-1 project, including the use of low-sulphur fuel and IMO Tier I NOx certified engines.

Marine source calculations assume a maximum fuel sulphur content of 0.10% m/m, in strict accordance with the Mediterranean SOx Emission Control Area (ECA) requirements effective from 1 May 2025. A sulphur content of 0.04% m/m has been assumed for Jet A-1 fuel, consistent with typical refinery specifications and international aviation fuel standards.

#### 6.10.1.2 Emission Calculations

Emission calculations are performed using the standard emission factors for Marine Gas Oil fuel from the European Environment Agency's emission inventory guidebook (*EMEP/EEA 2023, EMEP/EEA Air Pollutant Emission Inventory Guidebook, Technical guidance to prepare national emission inventories*, <https://www.eea.europa.eu/publications/emep-eea-guidebook-2023>).

Helicopter emissions are based on the Swiss FOCA/BAZL Guidance on the Determination of Helicopter Emissions, which provides methods and indicative factors for jet fuel combustion by helicopter type. The FOCA/BAZL methodology is not regulatory in Greece but is widely used in European ESIAs as a conservative screening-level approach in the absence of confirmed aircraft specifications.

In the absence of confirmed aircraft type and final logistics planning at the ESIA stage, the helicopter fuel consumption assumption represents a conservative upper-bound estimate pending confirmation of helicopter type, flight distance and rotation frequency. The helicopter emission factors and daily fuel use are conservative ESIA-stage estimates.

The emission factors applied in the assessment are summarised in Table 6-22.

Table 6-22: Emission Factors

| SOURCE (FUEL)                  | EMISSION FACTORS (KG/TONNE FUEL) |                 |      |                  |
|--------------------------------|----------------------------------|-----------------|------|------------------|
|                                | NOX                              | SO <sub>2</sub> | CO   | PM <sub>10</sub> |
| MODU and Support Vessels (MGO) | 72.20                            | 1.82            | 3.84 | 1.07             |
| Helicopter (Jet A-1)           | 18.00                            | 0.80            | 1.00 | 0.40             |

Source: Table 3-2, Tier 1 Emission Factors for Ships using Marine Diesel/Marine Gas Oil (EMEP/EEA, 2023)  
FOCA/BAZL "Guidance on the Determination of Helicopter Emissions", Edition 2 (2015)

Estimated daily emissions for each source are presented in Table 6-23, based on relevant emission factors (Table 6-22) and the activity data (fuel consumption) in Table 6-12.

Table 6-23: Estimated Daily Emissions

| SOURCE          | FUEL CONSUMPTION (T/DAY) | EMISSIONS (KG/DAY) |                 |       |                  |
|-----------------|--------------------------|--------------------|-----------------|-------|------------------|
|                 |                          | NOX                | SO <sub>2</sub> | CO    | PM <sub>10</sub> |
| MODU            | 43                       | 3,104.6            | 78.3            | 165.1 | 46.0             |
| Support vessels | 25                       | 1,805.0            | 45.5            | 96.0  | 26.8             |
| Helicopter      | 2                        | 36.0               | 1.6             | 2.0   | 0.8              |
| Total           |                          | 4,945.6            | 125.8           | 262.7 | 73.6             |

For the 67-day campaign, total emissions per source and pollutant are presented in Table 6-24.

Table 6-24: Total Emissions during Campaign

| SOURCE          | FUEL CONSUMPTION (T) | EMISSIONS (TONNES) |                 |       |                  |
|-----------------|----------------------|--------------------|-----------------|-------|------------------|
|                 |                      | NOX                | SO <sub>2</sub> | CO    | PM <sub>10</sub> |
| MODU            | 2,881                | 208.01             | 5.24            | 11.06 | 3.08             |
| Support vessels | 1,675                | 120.94             | 3.05            | 6.43  | 1.79             |
| Helicopter      | 134                  | 2.41               | 0.11            | 0.13  | 0.05             |
| Total           |                      | 331.4              | 8.4             | 17.6  | 4.9              |

### 6.10.1.3 Fugitive Emissions of Bulk Materials

Cement and barite are transported as dry bulk and pneumatically transferred from support vessels to MODU storage tanks using compressed air. Displaced air will be released through the tanks' venting and dust-control systems. These transfers will use closed-transfer systems, tank-venting arrangements, and visual monitoring to minimise material loss. Minor fugitive releases may occur through tank-venting systems during transfer.

## 6.10.2 Air Emissions from Onshore Activities

### 6.10.2.1 Air Emissions during Shore Base Establishment

The establishment of the temporary Supply Base will utilise existing port infrastructure and will not require major civil works, dredging, land reclamation or construction of permanent facilities. Consequently, air emissions associated with the setup phase are expected to be limited in scale, duration and spatial extent.

Minor combustion emissions, including nitrogen oxides (NO<sub>x</sub>), carbon monoxide (CO), non-methane volatile organic compounds (NMVOCs) and particulate matter (PM), will arise from vehicles and equipment used to transport, unload and position temporary facilities and materials within the port area. Such equipment may include forklifts, trucks, cranes and light-duty vehicles. Given the limited duration of these activities and the use of an existing paved port facility, emissions are expected to be temporary and localised.

Dust generation during establishment activities is anticipated to be negligible as the Supply Base will be located on existing paved or hardstanding surfaces. No excavation, earthworks or bulk material handling activities are planned. Any minor dust generated by vehicle movements will be short-lived and confined to the immediate work area.

Overall, air quality impacts associated with the establishment of the temporary Supply Base are expected to be minor, temporary and readily manageable through standard good housekeeping practices and maintenance of vehicles and material-handling equipment in accordance with manufacturer specifications.

### 6.10.2.2 Air Emissions from Shore Base Operation

Air emissions from drilling support operations associated with the onshore logistics base at the Port of Igoumenitsa will arise from the intermittent use of diesel-powered logistics and cargo-handling equipment within the Port of Igoumenitsa, including forklifts, trucks, cranes and other mobile plant used for loading, unloading, staging and transferring materials and wastes. These activities will generate routine combustion-related emissions including nitrogen oxides (NO<sub>x</sub>), particulate matter (PM), carbon monoxide (CO) and small quantities of volatile organic compounds (VOCs).

SO<sub>2</sub> emissions are expected to be very low due to the use of diesel fuel complying with the applicable EU fuel-quality requirements.

For the emission calculations, standard emission factors for diesel fuel from the European Environment Agency's emission inventory guidebook for Non-road Mobile Machinery (Tier 1) were used (*EMEP/EEA 2023, EMEP/EEA Air Pollutant Emission Inventory Guidebook, Technical guidance to prepare national emission inventories*, <https://www.eea.europa.eu/publications/emep-eea-guidebook-2023>).

The emission factors applied in the assessment are summarised in Table 6-25.

**Table 6-25: Emission Factors**

| SOURCE (FUEL)                           | EMISSION FACTORS (KG/TONNE FUEL) |       |       |      |
|-----------------------------------------|----------------------------------|-------|-------|------|
|                                         | NOX                              | CO    | NMVOC | PM10 |
| Shore base equipment operation (Diesel) | 32.63                            | 10.77 | 3.38  | 2.10 |

**Source: Table 3-1, Tier 1 Emission Factors for off-road machinery (EMEP/EEA, 2023)**

Based on activity data and fuel consumption for the shore base supporting activities (Table 6-13), estimated daily emissions, as well as total emissions for the 67-day campaign, are presented in Table 6-26.

**Table 6-26: Estimated Daily Emissions and Total Emissions during Campaign**

| SOURCE                  | EMISSIONS (KG/DAY) |        |       |       |
|-------------------------|--------------------|--------|-------|-------|
|                         | NOX                | CO     | NMVOC | PM10  |
| Emissions (kg/d)        | 9.59               | 3.17   | 0.99  | 0.62  |
| Campaign Emissions (kg) | 642.45             | 212.13 | 66.49 | 41.43 |

As these activities will be temporary, of limited duration and undertaken within an existing port operational area, the resulting air emissions are expected to be localised and short term. Air emissions will be minimised through routine equipment maintenance, efficient logistics planning to reduce unnecessary engine idling and vehicle movements, and the use of standard good industry practice for port-based handling operations. On this basis, emissions from shore equipment are not expected to result in significant adverse effects on local ambient air quality, although they will contribute in a minor way to the overall Project greenhouse gas footprint.

## 6.11 Carbon footprint

The carbon footprint of the Project comprises greenhouse gas (GHG) emissions associated with:

- Offshore operations, including
  - Drilling operations using a Mobile Offshore Drilling Unit (MODU);
  - Offshore support vessel operations (Platform Supply Vessels);
  - Helicopter operations (if applicable for crew change and emergency response).
- Onshore logistics support operations at the Port of Igoumenitsa (Supply Base).

Emissions are classified in accordance with the GHG Protocol and the Project's organisational and operational-control boundary as follows:

- **Scope 1:** Direct emissions from fuel combustion, including fuels consumed for MODU, PSVs, helicopter operations, onshore vehicles and equipment.
- **Scope 2:** Indirect emissions associated with electricity purchased for shore base operations.
- **Scope 3:** Indirect logistics (e.g. suppliers, waste management operations by certified contractors).

Stena Drilling's Energy Management System conforms to ISO 50001:2018 standard. The MODU's voluntary DNV Abate (P) notation provides a recognised framework for efficient power plant operation and greenhouse gas emissions abatement. This notation is considered good industry practice and supports continuous improvement in emissions management performance beyond minimum regulatory requirement.

Regulation (EU) 2024/1787 on the reduction of methane emissions in the energy sector entered into force on 4 August 2024 and establishes monitoring, reporting and verification requirements, together with restrictions on venting and flaring and leak detection and repair obligations for in-scope oil and gas assets and activities. Given that no hydrocarbon flow, well testing or routine venting is planned, dedicated methane

LDAR obligations are not expected to be triggered for the Asopus 1 drilling scope. However, Energean will apply contractor management systems and incident reporting procedures to ensure that any unexpected methane releases from scoped in equipment are identified, recorded and reported in accordance with Regulation (EU) 2024/1787.

The DNV Abate (P) notation and contractor management systems may support good practice in emissions control, energy efficiency and incident management. However, compliance with Regulation (EU) 2024/1787 will be determined by the actual scope of in-scope oil and gas activities and equipment, rather than by voluntary vessel notations or certifications.

For offshore support vessels of 400 GT and above calling at EU ports, greenhouse gas monitoring, reporting, and verification requirements under the EU MRV regime apply from 1 January 2025, with reporting undertaken through the applicable EU MRV system, including THETIS-MRV, where applicable.

The applicability of the EU Emissions Trading System and FuelEU Maritime Regulation to third-party marine assets will be addressed by the relevant ship operators through their own compliance arrangements and is managed by the respective vessel operators through their own statutory compliance arrangements and therefore does not form part of the project-specific mitigation measures assessed in this ESIA.

GHG emissions from offshore operations including MODU, PSVs and helicopter operations (Scope 1), are calculated using the ISO 14064-1:2018 standard (Table 6-27), based on activity data (fuel consumption) in Table 6-12. Emission factors are taken from the following sources:

- Annual publication of the Greek Ministry of Environment and Energy for the implementation of the National Climate Law, which are based on the most recent national emissions inventory (<https://ypen.gov.gr/perivallon/klimatiki-allagi/ethnikos-klimatikos-nomos/efarmogi-ethnikou-klimatikou-nomou>) for the calculation of emissions from Stena DrillMAX and Support vessels.
- 2006 IPCC Guidelines for National Greenhouse Gas Inventories. Volume 2: Energy, Chapter 3: Mobile Combustion for the calculation of emissions from helicopter operations.
- **Direct emissions from the onshore supporting operations** (Scope 1), are calculated using the ISO 14064-1:2018 standard (Table 6-28), based on activity data (fuel consumption) in Table 6-13. Emission factors are taken from the Annual publication of the Greek Ministry of Environment and Energy for the implementation of the National Climate Law, which are based on the most recent national emissions inventory (<https://ypen.gov.gr/perivallon/klimatiki-allagi/ethnikos-klimatikos-nomos/efarmogi-ethnikou-klimatikou-nomou>) for the calculation of emissions from onshore mobile equipment.

According to the above, the total carbon footprint of the drilling campaign is calculated in Table 6-29.

Table 6-27: GHG emissions (Scope 1) from offshore drilling operations

| FUEL TYPE                              | FUEL USE                | CAMPAIGN FUEL (T) | NCV (TJ/TN) | ENERGY (TJ) | EF CO <sub>2</sub> (TN CO <sub>2</sub> /TJ) | CO <sub>2</sub> EMISSIONS (TN CO <sub>2</sub> ) | EF CH <sub>4</sub> (KG CH <sub>4</sub> /TJ) | CH <sub>4</sub> EMISSIONS (TNCO <sub>2</sub> EQ) | EF N <sub>2</sub> O (KG N <sub>2</sub> O/TJ) | N <sub>2</sub> O EMISSIONS (TNCO <sub>2</sub> EQ) | TOTAL EMISSIONS (TN CO <sub>2</sub> EQ) |

| 15,467.81                 | 22.03                     | 106.71                     | 15,596.56               |

For the purposes of this ESIA and the project carbon-footprint assessment, emissions from the MODU, project support vessels, helicopter services and shore-base support equipment are included in the project's Scope/Category 1 inventory, as these activities are necessary to execute the drilling campaign and fall within the project's environmental-permitting boundary. This presentation sets out an ESIA-specific project-boundary convention and shall not be construed as a determination of ownership, financial control, or operational control for Energean. It does not establish, amend or predetermine the classification of these emissions in Energean's corporate GHG inventory, sustainability reporting, assured disclosures or any other corporate emissions account. Such reporting shall remain subject to Energean's approved organisational boundary, contractual-control assessment and applicable corporate GHG-reporting methodology.

The results show that the carbon footprint of the drilling campaign is dominated by offshore fuel combustion, with the MODU and support vessels contributing the vast majority of Scope 1 emissions. Helicopter and onshore activities represent only a marginal share of total emissions.

CO<sub>2</sub> is the principal greenhouse gas, with smaller contributions from CH<sub>4</sub> and N<sub>2</sub>O. Overall, the emissions profile is consistent with typical short-term offshore drilling operations and reflects the energy-intensive nature of marine power and propulsion requirements, rather than any process-specific or fugitive emissions.

Given the campaign's temporary duration and the absence of production, well testing, flaring or routine hydrocarbon venting activities, the overall impact is considered limited in scale and duration, with emissions largely confined to operational fuel combustion during the drilling campaign.

## 6.12 Noise and vibration emissions

---

Underwater sound in the marine environment arises from both natural and anthropogenic sources. Natural sources form part of the ambient acoustic environment. For the purposes of this ESIA, noise refers to anthropogenic underwater sound with the potential to cause adverse effects on marine fauna, including injury, disturbance, masking, or other ecologically relevant responses.

This assessment therefore focuses on Project-related underwater sound sources with the potential to affect marine fauna. These comprise the continuous operation of the MODU, particularly during dynamic positioning, support vessels and helicopters, and impulsive sound associated with potential vertical seismic profiling (VSP) operations.

### 6.12.1 Regulatory Controls

---

The principal regulatory instruments applicable to underwater noise include Directive 92/43/EEC on the conservation of natural habitats and of wild fauna and flora (Habitats Directive), Directive 2009/147/EC on the conservation of wild birds (Birds Directive), and Directive 2008/56/EC establishing a framework for community action in the field of marine environmental policy (Marine Strategy Framework Directive, MSFD), as implemented in Greece through, inter alia, Law 3937/2011 on biodiversity conservation and Law 4014/2011 on the environmental licensing of projects and activities.

Under the Habitats Directive, Member States are required to establish a system of strict protection for species listed in Annex IV, including a prohibition on deliberate disturbance, particularly during periods of breeding, rearing, hibernation or migration. This protection applies both within and outside designated

Natura 2000 sites. In Greek marine waters, this regime is applicable to cetaceans and marine turtles, and project-related underwater noise must therefore be assessed where it has the potential to cause injury, significant disturbance, or adverse effects on the conservation objectives of Natura 2000 sites.

Under the MSFD, underwater noise is identified as a human-induced pressure on the marine environment through Descriptor 11, which addresses the introduction of anthropogenic energy, including underwater sound, at levels that may adversely affect marine ecosystems. Descriptor 11 distinguishes between impulsive sound sources and continuous low-frequency noise. This distinction is directly relevant to the Project, as the potential VSP operations constitute an impulsive noise source, whereas the drilling unit and support vessels generate continuous non-impulsive noise.

Accordingly, this ESIA considers underwater noise in terms of its source characteristics, magnitude, duration, temporal pattern and spatial extent, and evaluates whether the proposed activities could result in significant effects on protected species or sensitive marine habitats.

Where the Project may have the potential to affect a Natura 2000 site, these matters are addressed through the Special Ecological Assessment required under Law 4014/2011, thereby incorporating the requirements of Article 6(3) of the Habitats Directive into the environmental licensing process. In this regulatory context, underwater noise from offshore hydrocarbon exploration activities must be assessed within the ESIA framework, and the Project will apply appropriate mitigation measures consistent with applicable Greek and EU legal requirements and relevant regional guidance, including resolutions and recommendations adopted under the Agreement on the Conservation of Cetaceans of the Black Sea, Mediterranean Sea and Contiguous Atlantic Area (ACCOBAMS).

Where relevant, the Project will consider the principles of the Offshore Protocol to the Barcelona Convention, which aims to prevent and reduce pollution from offshore exploration and exploitation activities.

## 6.12.2 Airborne Noise

### 6.12.2.1.1 MODU and Vessels

The main sources of airborne noise from the Project are expected to be vessel machinery, including engines, generators, pumps, ventilation systems, and deck equipment such as cranes. Noise levels onboard the MODU and support vessels will be managed in line with occupational health and safety requirements and maritime regulations to protect crew health and safety.

The MODU will be located about 44 km from the nearest island shoreline. At this distance, and given atmospheric sound attenuation and the offshore setting, airborne noise from the MODU and PSVs is not expected to cause perceptible or significant effects at onshore noise-sensitive receptors.

### 6.12.2.1.2 Helicopters

A medium twin-engine helicopter (AW139) will support offshore operations, including crew changes, critical small equipment delivery, surveillance, and emergency response. Small urgent items may be carried on personnel flights where payload capacity allows; routine cargo-only flights are not planned. Helicopter flights represent the only planned aircraft activity during normal Project operations and are expected to occur

several times per week. Where practicable, flights will follow established routes to and from Corfu International Airport (CFU) to minimise overflight of onshore noise-sensitive receptors.

Helicopter noise is generated primarily by engines, transmission systems, and main and tail rotor blade passage, with most energy at relatively low frequencies and additional broadband components. Given that flights are infrequent, of very short duration over any given location, and limited to defined approach and departure corridors, helicopter operations are assessed as representing a limited and highly transient contribution to the Project's overall noise emissions. The offshore location of the MODU (approximately 44 km from the nearest island shoreline), combined with the use of established offshore flight paths, means that helicopter overflights are not expected to result in perceptible or significant effects at onshore noise sensitive receptors.

### 6.12.3 Underwater Noise

#### 6.12.3.1 Underwater Sound and Assessment Metrics

Sound travels through liquids as longitudinal or compression waves. These waves produce alternating regions of compression and rarefaction due to deviations in pressure from equilibrium. Sound pressure ( $p$ ) is the average variation in pressure caused by sound. Sound pressure levels (SPL) are typically expressed in decibels (dB), a logarithmic scale that represents the ratio of two values of a physical quantity. It is used to measure the amplitude or 'loudness' of a sound.

As the dB scale is a ratio, it is expressed relative to a reference level, which must be specified with dB values for them to be meaningful. The reference pressure level in underwater acoustics is 1 micropascal ( $\mu\text{Pa}$ ), noted as dB re 1  $\mu\text{Pa}$ . Whereas the reference pressure level used in air is 20  $\mu\text{Pa}$ , which was selected to match human hearing sensitivity. As a result of these differences in reference standards, sound levels in air are not equal to underwater levels. Because underwater and airborne sound levels use different reference pressures and are measured in different acoustic media, values expressed in dB re 1  $\mu\text{Pa}$  and dB re 20  $\mu\text{Pa}$  are not directly comparable without careful qualification. For sound-pressure levels only, a commonly used rule of thumb is that underwater sound pressure levels expressed in dB re 1  $\mu\text{Pa}$  are approximately 61–62 dB higher than airborne levels expressed in dB re 20  $\mu\text{Pa}$ , although such comparisons should be treated with caution.<sup>50</sup> This is a reference-level conversion only and does not make airborne and underwater noise levels directly comparable in terms of propagation, perception or environmental effect.

Peak sound pressure is the maximum instantaneous sound pressure reached during a specified time interval and is expressed in pascals (Pa). The corresponding peak sound pressure level (peak SPL) is expressed in decibels (dB re 1  $\mu\text{Pa}$ ) and is useful for characterising impulsive signals such as air-gun pulses.

Root mean square (RMS) sound pressure level (SPL<sub>rms</sub>) is the level corresponding to the square root of the mean square sound pressure over a specified time interval. The underlying RMS sound pressure is expressed in pascals (Pa), whereas SPL<sub>rms</sub> is expressed in decibels (dB re 1  $\mu\text{Pa}$ ). When using SPL<sub>rms</sub> to quantify a transient sound source, the averaging period must be specified, as the SPL<sub>rms</sub> value depends on this interval.

<sup>50</sup> Assessment of the environmental impact of underwater noise, OSPAR, 2009, 41 pp

Underwater broadband ambient sound levels in offshore environments are primarily controlled by wind, sea state, precipitation and biological activity, with additional contributions from distant anthropogenic sources such as commercial shipping. In relatively quiet offshore conditions with low shipping influence and calm seas, broadband sound pressure levels (SPLrms) can be below 100 dB re 1 µPa, whereas in more typical shipping-influenced Mediterranean conditions, including those observed in the Ionian Sea, monitoring programmes have reported average broadband SPLrms of  $\sim 110 \pm 6$  dB re 1 µPa.<sup>51,52</sup> Ambient conditions in the Ionian Sea are therefore expected to vary over time depending on vessel traffic, weather and biological activity, and the Project sound field should be considered in the context of this already variable regional soundscape. See the Project's ESBS (**Annex 02**) for further information on the noise baseline.

Strong winds, heavy rainfall, or intense biological activity, such as biological choruses, can cause short-term increases of several tens of decibels above background sound levels. In the low-frequency range (approximately 20–500 Hz), ambient sound is often dominated by distant shipping noise, with large baleen whale vocalisations contributing when present. Weather-related noise from wind-driven waves and wave breaking typically dominates from a few hundred Hz to several kHz, and sometimes up to tens of kHz.<sup>53</sup>

Underwater sound levels generally decrease with distance from the source. The rate and pattern of propagation depend on source characteristics, water depth, the water-column sound-speed profile, bathymetry and seabed properties.

### 6.12.3.2 Underwater Noise – Non-Impulsive

Underwater sound emissions are commonly categorised as either non-impulsive (continuous) or impulsive. Non-impulsive sound is characterised by continuous or repeated non-pulsed emissions and may be tonal, broadband, or a combination of both.<sup>54</sup> Underwater non-impulsive sound emissions will be generated by the MODU and vessels (engine sound associated with transit and dynamic positioning operations and generators), the interaction of the formation-bit whilst drilling, and helicopter activities.

#### 6.12.3.2.1 MODU and Vessels

Project vessels are expected to generate underwater noise of a broadly similar character to that produced by other large commercial vessels currently operating in the Ionian Sea, although source characteristics will vary depending on vessel type, propulsion, speed and operational mode. The primary sources of underwater sound from vessels are propeller cavitation, propeller singing, and propulsion; other sources include hydrodynamic flow around the hull, bubbles breaking in the wake, and the operation of machinery and equipment. Propeller cavitation is typically the dominant source of underwater sound from vessels, and its intensity is generally related to vessel size, speed and loading characteristics.

<sup>51</sup> Fakiris et al., “Uncovering the soundscape of the Ionian Sea” (UACE 2023).

<sup>52</sup> ACCOBAMS, “Mediterranean technical assessment on anthropogenic underwater noise” (MOP9 Inf.25, 2025).

<sup>53</sup> DOSITS (Discovery of Sound in the Sea), Ocean Noise Variability and Noise Budgets.

<sup>54</sup> Southall BL, Bowles AE, Ellison WT, Finneran JJ, Gentry RL, Greene CR, Kastak Jr D, Ketten DR, Miller JH, et al. (2007) ‘Marine Mammal Noise Exposure Criteria: Initial Scientific Recommendations’, *Aquatic Mammals* 33(4): 411-521 <https://doi.org/10.1080/09524622.2008.9753846>.

Large vessels tend to produce higher sound levels than small ones, and vessels underway with a full load produce more sound than unladen vessels. For a given vessel, sound also tends to increase with increased speed. Representative broadband source levels for support vessels and other small to medium offshore vessels are commonly reported within the approximate range 170–195 dB re 1  $\mu$ Pa @1 m, depending on vessel size, propulsion characteristics and speed. Sound levels would generally decrease with distance from the source.

The MODU represents the dominant continuous (non-impulsive) underwater noise source during routine operations, with acoustic characteristics influenced primarily by thruster activity, propulsion systems, onboard machinery and operational mode, with additional smaller contributions from structure-borne vibration and drilling-related equipment. The underwater sound field is a superposition of sound from simultaneously operating sources, with energy arriving at a receiver via multiple propagation paths (e.g. direct, surface- and bottom-reflected).<sup>55</sup> Drilling noise and noise generated by onboard equipment tends to be dominated by low-frequency components.<sup>56</sup> Additional continuous underwater sound will be generated intermittently by support vessels.

Table 6-30 provides representative underwater source information for the principal Project vessel types, based on published values for comparable offshore sources. The values are representative source levels for comparable vessel types and do not constitute Project-specific measurements. Actual source levels will vary with vessel configuration, operating mode, propulsion demand, speed and environmental conditions.

**Table 6-30 – Representative Underwater Source Levels for Project Vessels**

| NOISE SOURCE         | SOUND TYPE                 | EXPECTED FREQUENCY RANGE, HZ | EXPECTED SPL <sup>57</sup>       |
|----------------------|----------------------------|------------------------------|----------------------------------|
| MODU                 | Non-impulsive (continuous) | 40 - 600                     | 195 dB re 1 $\mu$ Pa @ 1 m       |
| Support Vessel (PSV) | Non-impulsive (continuous) | 50 - 300                     | 180 - 190 dB re 1 $\mu$ Pa @ 1 m |

### 6.12.3.2.2 Helicopters

During approach to and departure from the MODU, the helicopter passes over the sea surface and helideck, during which a small proportion of airborne sound may couple into the water column. However, air-to-water acoustic coupling is weak, and any underwater sound associated with helicopter overflights is confined to

short periods directly beneath the aircraft and attenuates rapidly with increasing depth and horizontal distance.

Given that flights are infrequent, of very short duration over any given location, and limited to defined approach and departure corridors, helicopter operations are assessed as representing only a minor and highly transient contribution to the Project's overall underwater noise environment. In comparison with the continuous underwater noise generated by the MODU operating in dynamic positioning mode and by support vessels, helicopter-related underwater sound is expected to make only a negligible contribution to the overall Project underwater noise environment and is not expected to result in significant disturbance to marine fauna.

#### 6.12.3.2.3 Remotely Operated Vehicle (ROV)

During drilling, a single ROV will be deployed from the MODU to support routine and contingency subsea tasks. These tasks include periodic and as-required visual inspections of the blowout preventer (BOP) and marine riser, as well as pre- and post-drilling seabed inspections. Underwater noise from ROV operations is generated primarily by low-power electric thrusters and onboard equipment, producing low-intensity, highly localised sound.

ROV deployments will be intermittent, brief and localised to the vicinity of the subsea equipment and well location. The associated sound levels are much lower than those from the MODU in dynamic positioning mode or from support vessels. ROV operations are expected to contribute only minimally to underwater noise due to their low source levels, restricted operating area around the wellhead, and the dominance of noise from the MODU and dynamic positioning (DP) system.

### 6.12.3.3 Underwater Noise – Impulsive

Impulsive noise consists of short-duration, transient sound events with a rapid onset and broad frequency content in the low- to mid-frequency bands relevant to marine fauna. If undertaken, VSP operations will be conducted as part of formation evaluation following completion of the relevant hole section

To minimise disturbance to marine fauna, the Project will implement standard mitigation measures during VSP operations. The assessed measures include a soft start before full source activation and visual monitoring for marine mammals before and during source initiation, subject to the final approved protocol.

#### 6.12.3.3.1 Vertical Seismic Profiling (VSP)

VSP operations will be conducted following completion of drilling activities. For the purposes of this assessment, the acoustic source is assumed to comprise a small air-gun array with a total source volume of up to 1,000 in<sup>3</sup>, deployed approximately 5-10 m below the sea surface from the MODU. Data acquisition is limited in duration, typically lasting up to 12 hours per section, with a maximum of two sections and up to approximately 130 shots per section.

During VSP operations, impulsive sound energy is transmitted from a near-surface source to receivers located within the wellbore. The emitted sound energy is predominantly directed towards the seabed and

subsurface geological formations, with the highest sound levels occurring immediately beneath the source. Each air-gun discharge also ensonifies the surrounding water column, generating a short-duration, low-frequency impulse whose received level decreases with increasing distance from the source.

The sound energy produced during VSP operations is substantially lower than that associated with conventional 2D or 3D marine seismic surveys, both in terms of individual source volume and total acoustic energy. Consequently, the spatial extent and duration of underwater noise exposure from VSP activities are expected to be limited in comparison with large-scale 2D or 3D seismic surveys, and the contribution of these activities to regional impulsive noise under MSFD Descriptor 11 is correspondingly limited in time and space.

The VSP source considered for the Project comprises a small air-gun array of four 250 in<sup>3</sup> guns, with a total discharge volume of 1,000 in<sup>3</sup>, deployed for formation evaluation at a single well location. The VSP is expected to involve a limited number of shots (up to approximately 260 shots across two short sections), undertaken over brief operational periods separated by several days. This source configuration remains substantially smaller in total acoustic output, duration and spatial extent than typical 2D or 3D marine seismic survey arrays.

#### 6.12.3.3.2 Acoustic Positioning

Acoustic positioning systems (e.g. Ultra-Short Baseline - USBL), if used in support of drilling operations, emit high-frequency, short-duration acoustic pulses at intermittent intervals. Such systems are standard for offshore drilling operations and are characterised by very limited spatial extent and short emission durations. Any underwater sound generated by acoustic positioning equipment would be highly localised and minor when compared with continuous MODU and dynamic positioning noise. Accordingly, acoustic positioning systems are not expected to result in significant underwater noise effects.

### 6.12.4 Noise emissions from onshore logistics support

Noise emissions at the shore base are similarly limited and arise from intermittent operation of mobile equipment, including forklifts, trucks, cranes, and auxiliary machinery used during cargo handling and storage activities.

Noise is expected to be typical of standard port operations, consisting mainly of short-duration, low-frequency mechanical noise associated with engine use, lifting operations, and vehicle movements. Because activities will take place within an established port area, these sound sources will be absorbed into the existing industrial noise environment.

The temporary nature of operations, combined with the limited number of personnel (approximately six workers) and the absence of heavy construction or continuous industrial activity, means that noise generation will be intermittent rather than continuous. Any potential disturbance will therefore be localised within the port boundary and will not extend to surrounding residential receptors at significant levels.

## 6.13 Electromagnetic radiation and radioactivity emissions

### 6.13.1 Radioactive Sources

---

Radioactive materials will not be routinely stored onboard the MODU. However, sealed radioactive sources may be used intermittently during logging-while-drilling (LWD) and wireline logging operations undertaken for formation evaluation. These may include americium-beryllium (Am-241/Be) neutron sources and caesium-137 (Cs-137) gamma sources. The sources will be sealed and encapsulated within specialised downhole logging tools in accordance with applicable standards for well-logging sources.

During normal operations, sealed sources will be deployed and recovered with the logging tools following each operation. There are no planned discharges or releases of radioactive material to the marine environment. Any source-recovery contingency, including a source becoming lodged or lost in the well, will be managed in accordance with the applicable radiation-safety and emergency procedures.

The use of sealed radioactive sources will be limited to the source types, activities and quantities authorised under the applicable licences issued by the Greek Atomic Energy Commission (EEAE) and Greek radiation-protection requirements. Transportation, temporary storage, handling, use and emergency source-recovery arrangements will be managed by the specialist logging contractor under its approved Radiation Safety Manual and applicable licence conditions, in compliance with Council Directive 2013/59/Euratom as implemented in Greek legislation.

These arrangements will include controls for source inventory, security, handling, personnel exposure and emergency preparedness. Sealed radioactive sources are not chemical substances or planned discharge streams and will be managed separately from the chemicals addressed in the Chemical Use Plan (**Annex 05**).

### 6.13.2 Naturally Occurring Radioactive Material

---

Production-related accumulation of naturally occurring radioactive material (NORM) is not expected because the Project does not include hydrocarbon production, processing or produced-water handling. If any material suspected of containing elevated NORM is identified, it will be managed in accordance with the applicable radiation-protection and waste-management requirements.

## 6.14 Decommissioning Phase – site restoration

### 6.14.1 Time or Conditions Estimation for Operation Cessation

---

The decommissioning phase of the Asopus-1 exploration well will commence immediately following completion of drilling and formation evaluation activities. As the project is limited to exploration drilling, no production phase is planned. Accordingly, the well will be permanently plugged and abandoned (P&A) prior to demobilisation of the mobile offshore drilling unit (MODU).

The timing of decommissioning activities is therefore directly linked to the conclusion of drilling operations and is expected to occur within the overall duration of the drilling campaign. All decommissioning activities

will be conducted in accordance with the Notification of Well Operations accepted by HEREMA before commencement of drilling.

## 6.14.2 Offshore decommissioning

### 6.14.2.1 Demobilisation of MODU

---

Following permanent plugging and abandonment of the well, the MODU will be disconnected from the well and prepared for demobilisation. The blowout preventer (BOP) and marine riser will be disconnected, flushed with seawater as required, and recovered to the MODU, the K-BOS shall also be recovered to the MODU.

All temporary subsea equipment deployed during the drilling campaign, including acoustic positioning transponders and any clump weights, will be retrieved using a remotely operated vehicle (ROV). A post-operation seabed survey will be conducted to confirm clearance of debris and recovery of equipment.

The MODU will then depart the operational area using its own propulsion system. As no anchors are deployed during operations, no anchor recovery or associated seabed disturbance is required.

### 6.14.2.2 Decommissioning of Wellhead

---

Well decommissioning will be undertaken through plug and abandonment (P&A), in accordance with the NoWO and established offshore drilling practices. Cement plugs will be installed to create rock-to-rock barriers across the reservoir section and any permeable formations with flow potential, preventing crossflow and minimising the risk of unintended fluid release.

Following installation and verification of abandonment barriers using the methods specified in the final abandonment programme, the wellhead will be left in situ

After the recovery of the subsea equipment, the MODU-deployed ROV will undertake a post-operation seabed survey to confirm recovery of Project equipment and the absence of Project-related debris in the vicinity of the well.

### 6.14.2.3 Restoration of the occupied site

---

Overall, no specific restoration measures beyond confirmation of seabed clearance are required.

## 6.14.3 Onshore decommissioning

---

Once the drilling campaign concludes and the MODU departs, the temporary logistics base will be gradually demobilised. All project-specific temporary facilities and equipment, including portable offices, storage units, handling tools, temporary fencing, signage, and barriers, will be dismantled and removed from the port area.

Remaining materials and backload items will be processed for return to suppliers, transfer to licensed waste management facilities, or transport to other operational bases. Temporary signage, barriers, and traffic management systems installed for the project will be dismantled. The Project area will be inspected and left

in the condition agreed with the Port Authority. Demobilisation activities will be conducted in accordance with environmental, health, and safety procedures, with particular attention to spill prevention, waste handling, and minimising disruption to ongoing port operations

The Project will utilise existing facilities at the Igoumenitsa supply base and does not include construction of permanent onshore infrastructure. Upon completion of offshore activities, use of the logistics base for the Project will cease.

Any materials, equipment, or wastes associated with the drilling campaign will be removed from the site in accordance with operational procedures and applicable regulatory requirements.

#### 6.14.3.1 Demolition of permanent structures, removal of equipment and materials, and methods of disposal

---

No permanent structures will be constructed as part of the Project; therefore, no demolition activities are required.

All equipment and materials mobilised in support of the drilling campaign, including chemicals, drilling consumables, and wastes returned from offshore operations, will be removed from the logistics base. Materials will be returned to suppliers, reused, or managed through appropriate waste handling and disposal routes in accordance with applicable requirements.

#### 6.14.3.2 Restoration of the occupied site

---

As no permanent facilities or land take are associated with the Project, restoration requirements are limited. Any temporary use of areas within the logistics base will cease following completion of operations, and areas will be left in a condition consistent with their pre-existing use. No physical restoration works are anticipated beyond the removal of Project-specific temporary facilities, equipment, materials, and waste, and the completion of any close-out actions agreed with the Port Authority.

#### 6.14.4 Carbon footprint after completion of project operation

---

Following completion of drilling, formation evaluation, and well decommissioning or suspension, a short-term demobilisation phase will take place. During this phase, emissions will continue to be generated from the transport of personnel, equipment, and materials. These include MODU transit from the operational area, return of support vessels to port, transfer of equipment and materials to shore, and helicopter flights associated with crew changes and final personnel demobilisation.

These activities are temporary and limited in duration and are comparable in nature and scale to mobilisation activities described in Section 6.5. No new or additional emission sources are introduced during demobilisation beyond those already assessed for routine operations.

Upon completion of demobilisation, all offshore and associated support activities will cease. The wellhead shall be left in situ, as it is a passive structure with no associated emissions.

Onshore, use of the Igoumenitsa supply base will cease following completion of operations, and no ongoing emission sources will remain associated with the Project.

Accordingly, while minor, short-term greenhouse gas emissions will occur during the demobilisation phase, the Project does not result in any ongoing or residual emissions following completion of activities. The overall carbon footprint is therefore limited to the temporary duration of the mobilisation, drilling and demobilisation phases, with no long-term contribution to atmospheric emissions.

## 7 Alternative Solutions

The Project team used Energean's experience in Greece, Italy, Israel, and other regions to assess the proposed exploration in Block 2. This chapter compares key alternatives, summarising their advantages and disadvantages, with an emphasis on environmental impact, compliance with relevant Greek and EU requirements, including the Offshore Protocol, and adaptation to climate change. The following main principles guided the design selection:

- Avoid harm to people, consistent with applicable health and safety legislation and Energean's corporate policies.
- Minimise the environmental footprint.
- Minimise risks and ensure technical feasibility.

The alternatives assessment for the Asopus-1 exploration well was conducted during the early design stages, when changes could still materially affect environmental performance. The screening focused on technically feasible options and compared alternative technologies and approaches to minimise the environmental footprint of a single offshore exploration well, including reducing well length, drilling duration, logistics requirements, and associated emissions. Activities related to hydrocarbon production, well testing, or field development were excluded from this assessment.

Energean follows a phased, structured process with clear evaluation criteria, from business case identification to investment decision (Figure 7-1), considering impacts across the entire value chain.

Figure 7-1: Energean Project Development Process

As the design matured, options were progressively narrowed to those technically feasible and environmentally acceptable for the exploration well.

### 7.1 No-Action Alternative

The No-Action Alternative was retained throughout project planning as the baseline alternative against which the environmental and socio-economic implications of the proposed exploration programme were evaluated.

### 7.1.1 Technical and Strategic Implications

Under the No-Action Alternative, the Asopus structure within Block 2 would remain unevaluated, and no exploration drilling would be undertaken.

The main consequence of the No-Action Alternative is the continuation of the current level of subsurface uncertainty within Block 2. No direct geological, geophysical or reservoir data would be acquired to confirm the presence, extent or characteristics of potential hydrocarbon resources. As a result:

- Both the Project proponents and HEREMA would continue to rely on indirect interpretations derived from existing seismic and regional datasets, with no additional drilling-derived data available to reduce uncertainty or refine basin understanding.
- Knowledge of the offshore resource potential within Block 2 would not be advanced through empirical data acquisition, and the potential role of the area within future national or regional energy considerations would remain uncertain.
- Minimum work programme commitments under the Block 2 Lease Agreement would not be fulfilled, which may result in partial or full licence relinquishment in accordance with contractual provisions and the applicable regulatory framework.

### 7.1.2 Environmental and Scientific Considerations

From an environmental perspective, implementing the No-Action Alternative would avoid the short-term, localised impacts associated with offshore exploration drilling activities. In particular:

- There would be no project-related atmospheric emissions, underwater noise, seabed disturbance or operational discharges associated with drilling operations.
- The Project would not add project-specific pressures to environmental effects in the area during the exploration period.

At the same time, offshore environmental surveys and monitoring activities associated with the Project would not be undertaken. Consequently, no additional site-specific environmental data would be generated to support marine scientific knowledge, Marine Spatial Planning (MSP), or the implementation of the Marine Strategy Framework Directive (MSFD). In addition, the Project-specific application of Best Available Techniques (BAT) and Best Environmental Practices (BEP) within an operational offshore context would not occur.

### 7.1.3 Socio-economic Considerations

Under the No-Action Alternative, no project-related economic activity would be generated. In particular:

- There would be no use of port facilities, marine or aviation logistics, or associated support services at the local or regional level.
- No temporary service demand linked to the exploration campaign would arise.
- Estimated short-term investment associated with the exploration drilling campaign, amounting to approximately €12 million in expenditure associated with the exploration drilling campaign at the

national and local level, would not occur under the No Action Alternative.

- Under the No Action Alternative, exploration drilling in Block 2 would not proceed. As a result, any long-term benefits to the Greek State dependent on successful hydrocarbon identification and appraisal, including fiscal and socio-economic effects, would not be realised. The subsurface resource potential of Block 2 would also remain unassessed, thereby reducing the information available for future national energy policy and strategic planning.

Greece currently consumes in the order of 5-6 billion cubic metres (BCM) of natural gas annually. Preliminary geological assessments for the Asopus-1 prospect in Block 2 indicate a potential gas initially in place (GIIP) in the order of 270 BCM. However, these estimates remain highly uncertain and require verification through exploration drilling and subsequent appraisal. They do not represent proven reserves.

Between 2023 and 2025, Greece is estimated to have imported an average of about €19 billion per year in energy products, including crude oil, natural gas, and refined petroleum products, accounting for nearly a quarter of total goods imports.

In this context, the No Action Alternative means that Block 2's potential contribution to domestic subsurface knowledge, as well as its possible relevance to future energy supply diversification and national energy planning, would not be further evaluated in the current ESIA.

## 7.2 Description of Alternative Solutions

### 7.2.1 Introduction

The assessment of alternatives for the Asopus-1 exploration well followed a structured screening process, as illustrated in Figure 7-2.

Options were grouped by the main design and operational choices that can materially influence environmental performance, technical feasibility, safety, logistics requirements and overall project footprint. This included consideration of alternative well locations and trajectories, drilling unit type, drilling sequence, drilling fluids and cuttings management, cementing approach, lighting requirements, decommissioning strategy and supporting logistics infrastructure.

The purpose of this process was to identify the solution that best meets the exploration objectives while applying minimisation-by-design principles and ensuring consistency with regulatory requirements and good international industry practice.

The Project does not include well testing or routine flaring activities. These activities were excluded from the Project scope and therefore were not carried forward as preferred operational options.

In addition to technical and operational considerations, alternatives were screened against known environmental and spatial planning constraints, including Natura 2000 sites, marine protected areas, key fisheries activities, shipping routes, and available marine environmental baseline information. No environmental constraint was identified that would preclude drilling within the selected exploration target area. Environmental considerations were incorporated into the selection process with the objective of avoiding or minimising unnecessary disturbance wherever technically practicable.

The alternatives assessment applied the mitigation hierarchy principles of avoidance and minimisation during project design. For a temporary exploration activity with no permanent production infrastructure, environmental impacts were primarily reduced through design selection, location optimisation, use of existing infrastructure and minimisation of offshore activity duration.

Figure 7-2: Summary of options considered for exploration drilling

## 7.2.2 Exploration Well Location

Alternative locations for the single Asopus-1 exploration well were assessed to maximise the likelihood of evaluating key exploration targets, while retaining a single-well scope and seeking to minimise drilling complexity, duration, and environmental impact. The assessment used the available 3D seismic data, structural restoration, and the current depositional model for the Asopus structure. Key factors included structural position, fault-block configuration, and predicted reservoir facies and porosity distribution.

The primary alternative location 1A is on the structurally highest part of the structure (crestal). It was selected for its favourable structural position, proximity to the platform margin, and potential reef-influenced facies. According to the current geological model, these settings are more likely to contain well-developed porous reservoir intervals than more interior platform areas.

An alternative location, referred to as 1B, was identified within a separate structural fault block. This location is situated further within the carbonate platform, where reservoir development is interpreted to be less favourable than at location 1A. Consequently, 1B was considered a less suitable location for the Asopus-1 exploration well, which is designed to test and de-risk the primary play.

Additional locations further north were considered during screening. However, they did not offer a clear geological advantage over the primary site for the main exploration objectives and were not selected as preferred options.

Asopus-1A was selected as the preferred location because it meets the main exploration objectives with a single well in the most favourable structural and reservoir setting (Table 7-1). This choice supports minimisation-by-design principles by helping to reduce expected drilling time, logistics, and environmental impact. 1A is therefore the preferred location for the Asopus-1 exploration well.

**Table 7-1: Summary of Well Location Alternative Analysis**

| OPTION                                | REGULATORY COMPATIBILITY                                                                                                                                  | TECHNICAL FEASIBILITY                                                                                                                                                                                                             | FINANCIAL FEASIBILITY                                                                                                                                                                        | ENVIRONMENTAL COMPATIBILITY                                                                                                                                                                                                                                           | OVERALL ASSESSMENT                                                                                                                                                                      |
|---------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Location 1A</b>                    | Consistent with the Block 2 Lease Agreement and exploration objectives. Supports fulfilment of minimum work programme commitments if drilled as Asopus-1. | Located on the structural crest with a favourable fault-block position and proximity to platform-margin/reef-influenced facies. Considered the most prospective location for testing the exploration target.                      | Unit well cost is expected to be broadly similar to other locations; higher probability of meeting exploration objectives makes this location more efficient from an investment perspective. | Environmental impacts were not considered materially different between alternative locations as all options involved a single exploration well and similar offshore operating activities. Selection was therefore primarily based on geological and technical factors | <b>Preferred option.</b> Preferred location. Provides the most favourable combination of structural position, reservoir prospectivity and exploration efficiency for the Asopus-1 well. |
| <b>Location 1B</b>                    | Consistent with the Block 2 Lease Agreement and exploration objectives. Supports fulfilment of minimum work programme commitments if drilled as Asopus-1. | Technically drillable but situated in a more interior platform setting where reservoir development and porosity are interpreted to be less favourable than at 1A, implying a lower probability of meeting exploration objectives. | Unit well cost is expected to be comparable to 1A. However, lower expected reservoir quality and exploration success probability reduce overall investment efficiency.                       | Environmental impacts were not considered materially different between alternative locations as all options involved a single exploration well and similar offshore operating activities. Selection was therefore primarily based on geological and technical factors | <b>Not preferred.</b> Less favourable location. Technically feasible but offers lower geological prospectivity and reduced likelihood of meeting exploration objectives compared to 1A. |
